Berkeley, CA 94710-2737

Subject: Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2006, Presidio-Wide Quarterly Groundwater Monitoring Program, Presidio of San Francisco, California

Dear Devender and Robert:

Attached please find one hard copy and one electronic copy of the *Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2006, Presidio-Wide Quarterly Groundwater Monitoring Program, Presidio of San Francisco (Volumes I and II)* prepared by Treadwell & Rollo for the Presidio Trust. This document is being submitted in accordance with Task 11 of the RWQCB Order R2-2003-0080.

Please feel free to call me at 415-561-4259 if you have any questions and/or comments.

Sincerely,
The Presidio Trust

Craig Cooper
Remediation Program Manager

Enclosure

TCE	trichloroethene
TCP	1,2,3-trichloropropane
TDS	total dissolved solids
THR	Tennessee Hollow Restoration
TMB	trimethylbenzene
Towill	Towill, Inc.
TOC	total organic carbon
TPH	total petroleum hydrocarbons
TPHfo	total petroleum hydrocarbons as fuel oil
TPHg	total petroleum hydrocarbons as gasoline
TPHd	total petroleum hydrocarbons as diesel
TPHmo	total petroleum hydrocarbons as motor oil
TPHss	total petroleum hydrocarbons as stoddard solvent
Treadwell & Rollo	Treadwell & Rollo, Inc.
Trust	The Presidio Trust
TSS	total suspended solids
μg/L	micrograms per Liter
UST	underground storage tank
VOC	volatile organic compound

SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

E.1 EXECUTIVE SUMMARY

The Presidio-Wide Quarterly Groundwater Monitoring Program continued, with modifications, during the First and Second Quarters 2006. The First Quarter 2006 sampling event began on 6 March and was completed on 29 March 2006. The Second Quarter 2006 sampling event began on 23 May and was completed on 30 May 2006. This executive summary serves as a semi-annual summary of the groundwater monitoring program at the Presidio for the first half of 2006.

E.1.1 Changes to the Quarterly Groundwater Monitoring Program, First and Second Quarters 2006

Several modifications to the Presidio-wide Quarterly Monitoring Program were implemented during the First and Second Quarters 2006. Changes to the monitoring program are depicted in red text in Tables 1A and 1B. The majority of the changes were associated with reductions in sampling frequency at sites with decision documents in place. All changes approved for the First and Second Quarters 2006 are summarized below and are detailed in Tables 1A and 1B, respectively.

E.1.1.1 First Quarter 2006

The following changes were approved and implemented during the First Quarter 2006, as detailed in Table 1A.

Sampling Method Modifications

No monitoring well, piezometer, or seep sampling method modifications were proposed during the First Quarter 2006.

Analytical Additions and Reductions

Several changes in the sampling and analytical program scope were approved for the First Quarter 2006. The following changes were approved and implemented during the First Quarter 2006, as detailed in Table 1A.

- Chlorinated herbicide analysis was removed from the Landfill 8 monitoring program due to a lack of detections. Measurement for ORP by field probe, for the evaluation of redox conditions, was added to the Landfill 8 monitoring program.

- Chlorinated herbicide analysis was removed from the Building 1349 Area monitoring program within monitoring wells 1349MW02, 1349MW03R, and 1349MW100 through 1349MW102 due to a lack of significant detections, in accordance with the Fill Site 5 RAP. Measurement for ORP by field probe, for the evaluation of redox conditions, was added to the Building 1349 Area monitoring program.

- Chlorinated herbicides and PCB analyses were removed from Fill Site 5 monitoring program within monitoring wells LF5GW100 through LF5GW104 due to a lack of detections, in accordance with the Fill Site 5 RAP. In addition PCB analysis was removed from the monitoring program at the surface water seep LF5SP100 due to a lack of detections, in accordance with the Fill Site 5 RAP. Measurement for ORP by field probe, for the evaluation of redox conditions, was added to the Fill Site 5 monitoring program for monitoring wells LF5GW100 and LF5GW101.

- Landfill 4 monitoring wells have met the post-remediation RAP requirements for TPH, PAHs, VOCs, OCPs, and chlorinated herbicides for the required frequency of monitoring and therefore, these analytical compounds are no longer include in the monitoring program at Landfill 4. General chemistry parameters, dissolved metals, TDS, and PCBs met the RAP post-remediation requirements within Landfill 4 monitoring wells LF04GW03, LF4GW100 through LF4GW102, LF4GW105 and LF4GW106, and therefore, these analytical compounds are no longer included in the Landfill 4 monitoring program for these wells. However, due to recent cleanup level exceedances for nickel and aroclor 1260, and fluctuating general chemistry parameters within monitoring wells LF4GW103 and/or LF4GW104, these analytical compounds will continue to be monitored on an annual basis (except for PCBs which will be semi-annual) within these wells.

- Dissolved gases were removed from the Commissary/PX Area monitoring program for the evaluation of redox conditions in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006). Measurement for ORP by field probe, for the evaluation of redox conditions, was added to the Commissary/PX Area monitoring program.

- Chlorinated herbicide analysis was removed from the Landfill E monitoring program due to a lack of detections. Measurement for ORP by field probe was added to the list of parameters for monitoring well DAEGW07. Groundwater sampling frequency at the Landfill E seep DAESP03 was increased to quarterly to assess seasonal and variable conditions.

- Semi-annual measurement for ORP by field probe was added to the list of parameters for monitoring well NKGW03 at the Nike Facility.

- At the request of the DTSC, piezometer BB3PZ102 and surface water location BB3SW104 were added to the Baker Beach Disturbed Area 3 monitoring program to evaluate downgradient and surface water dissolved and total metal concentrations. TPHg, TPHd, and TPHmo analyses were reduced to semi-annual in surface water locations BB3SW101 and BB3SW102, in accordance with the RAP, as TPH has not been detected at these locations during the last four quarters.

- Measurement for ORP by field probe, for the evaluation of redox conditions, was added to the Battery Howe/Wagner monitoring program.

- Dissolved gases for the evaluation of redox conditions was removed from the Fill Site 6A/6B Area monitoring program, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006). Measurement for ORP by field probe, for the evaluation of redox conditions, was added to all monitoring wells in the Fill Site 6A/6B Area monitoring program.

- Dissolved gases for the evaluation of redox conditions was removed from the Building 1065 Area monitoring program, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006). Measurement for ORP by field probe, for the evaluation of redox conditions, was added to all piezometers and monitoring wells in the Building 1065 Area.

- Dissolved gases for the evaluation of redox conditions was removed from the Building 207/231 Area monitoring program, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006). Measurement for ORP by field probe, for the evaluation of redox conditions, was added to all piezometers and monitoring wells in the Building 207/231 Area.

- One round of confirmation sampling for PAHs was added to the Mini-CAP Area wells list of analyses to confirm previous sampling where PAH laboratory reporting limits were greater than cleanup levels. In addition, one round of confirmation sampling for VOCs was added to the monitoring well 1231GW101 list of analyses to confirm the presence of VOCs.

E.1.1.2 Second Quarter 2006

The following changes were approved and implemented during the Second Quarter 2006, as detailed in Table 1B.

Sampling Method Modifications

No monitoring well, piezometer, or seep sampling method modifications were proposed during the Second Quarter 2006.

Analytical Additions and Reductions

There were some additions and a minor reduction in the sampling and analytical program scope approved prior to the Second Quarter 2006, as detailed below.

- At the El Polin Spring, cyanide analysis was reduced to annual sampling because it has not been detected since 1994. TDS analysis was reduced to annual sampling based on a lack of significant detections.

- TPH, PAHs, VOCs, PCBs, general chemistry parameters, TDS, and dissolved metals have met their post-remediation groundwater monitoring requirements and cleanup levels per the Fill Site 5 RAP for the required frequency of monitoring events within all Fill Site 5 monitoring wells and monitoring wells 1349MW03R, 1349MW101, and 1349MW102 prior to the Second Quarter 2006. The Trust requested the cessation of these parameters from the Fill Site 5 monitoring program prior to the Second Quarter 2006. The monitoring of OCPs will continue until the Colma backfill soil sampling has been conducted.

- PAH and VOC analyses within Commissary/PX Area monitoring well 600GW108 were reduced to annual within the First Quarter. PAHs have never been detected and VOC detections have not been significant in the last four quarters within 600GW108. Total organic carbon was removed from the Commissary/PX Area monitoring program in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

- Baker Beach Disturbed Area 1 and 2A were added to the groundwater monitoring program prior to the Second Quarter 2006. Two piezometers (BB1PZ100 and BB1PZ101) and one surface water seep (BB2ASW100) were scheduled to be sampled quarterly for general chemistry parameters, dissolved and total metals, OCPs, PAHs, TPHd, and TPHfo.

- The sampling frequency for dissolved metals and general chemistry parameters were increased to quarterly analysis within Battery Howe/Wagner monitoring wells for comparison to data collected from new upgradient wells 1213GW101 and 1221GW104 in the Mini-CAP Area.

- Total organic carbon was removed from the Fill Site 6A/6B Area monitoring program in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

- Total organic carbon was removed from the Building 1065 Area monitoring program in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

- Total organic carbon was removed from the Building 207/231 Area monitoring program in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

- VOC analysis was increased to quarterly beginning in the Second Quarter 2006, based on VOCs detections within Mini-CAP Area monitoring well 1213GW101 during the First Quarter 2006. BTEX and MTBE are included on the VOC list and were therefore removed as a separate analysis. The PAH fluoranthene was detected within monitoring wells FMI4EX07GW102 and 514AGW101 during the First Quarter 2006, therefore wells with PAH detections were scheduled for analysis on a quarterly basis beginning in the Second Quarter 2006.

- Landfill 10 monitoring well LF10GW02 and surface water seep LF10SP01 were scheduled for sampling during the Second Quarter 2006 because they could not be accessed during the First Quarter 2006 due to overgrown vegetation. TPH analysis was increased to quarterly beginning in the Second Quarter 2006 due to recent detections in Landfill 10 monitoring wells.

E.1.2 Arsenic and Redox Evaluations

Arsenic speciation, dissolved gases and total organic carbon analyses, for the evaluation of redox conditions, were removed from the Presidio-wide groundwater monitoring program, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

Additionally, the *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006), concluded that ORP is a good indicator for evaluating changing redox conditions. Temperature, pH and ORP data were added to the Building 1349 Area, Building 231/207 Area, Building 1065 Area and the Commissary/PX Area groundwater monitoring programs as a field measurements and will be used in the ongoing redox evaluations at CAP sites.

ORP was to further aid in evaluating groundwater redox conditions.

E.1.3 Significant Observations and Accomplishments in First and Second Quarters 2006

Significant changes or trends in groundwater characteristics and chemistry as well as significant site-specific milestones are discussed below. Changes to proposed site-specific sampling schedules are discussed in the site-specific sections of Appendix A.

E.1.3.1 Building 900s Area (Appendix A-1)

Groundwater elevations, gradients, and flow directions during First and Second Quarters 2006 are consistent with historical values and interpretations. VOC concentrations detected during the First Quarter 2006 did not exceed their respective RAP-specified cleanup levels. The majority of VOC concentrations detected during the First Quarter 2006 were within the range of previously detected concentrations. The only monitoring well with significantly higher VOC concentrations was shallow well 950GW108, which had a higher concentration of total 1,2-DCE detected than in any previous monitoring event.

The relative concentration ratios of TCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride within Building 900s groundwater samples continue to indicate that natural biodegradation processes are occurring. The ratios of TCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride will continue to be monitored in future events.

TPHg and TPHd were detected in the shallow monitoring well 937GW108 sample at concentrations of 140 and 55 µg/L, respectively. The detected TPH concentrations within 937GW108 were at or near their lowest historical concentrations. TPHd was detected for the first time at 950GW108, but only in the duplicate sample at a concentration of 120 µg/L.

The sampling frequency at the Building 900s Area will continue to be annual per the Crissy Field RAP. The first five-year review will be completed in 2007.

E.1.3.2 Landfill 8 (Appendix A-2)

Groundwater elevations, gradients, and flow directions during First and Second Quarters 2006 are consistent with historical values and interpretations. The five Landfill 8 monitoring wells were sampled and analyzed during the First Quarter 2006 (annual basis) according to the proposed sampling schedule. Most general chemistry results from the First Quarter 2006 were within the range of previously detected concentrations within Landfill 8 Area monitoring wells.

Cyanide was detected in the duplicate sample collected from LF08GW04 at a concentration of 0.03 mg/L, slightly above the detection limit of 0.01 mg/L. Cyanide has been detected only three times since groundwater monitoring began in the mid-1990s. Groundwater samples from Landfill 8 monitoring wells LF08GW04 (0.03 mg/L) from the First Quarter 2006 and LF08GW06 (0.02 J- mg/L) from the Third Quarter 2003 exceed the applicable cleanup level for

cyanide of 0.0052 mg/L. Future detections of cyanide will continue to be monitored and trends identified as they become apparent.

Sulfide results for Landfill 8 monitoring well samples collected during the First Quarter 2006 were rejected during data validation due to a MS/MSD percent recovery failure.

No OCPs, PCBs, or chlorinated herbicides were detected in the Landfill 8 groundwater samples collected during First Quarter 2006, nor have they been historically detected above the laboratory reporting limits. VOCs were not detected in Landfill 8 groundwater samples collected during the First Quarter 2006.

No other significant trends or observations were identified at Landfill 8 during First Quarter 2006. The sampling frequency at Landfill 8 has been reduced to annual monitoring, until the Landfill 8 RAP is finalized and implemented. Sampling at Landfill 8 will then be performed per the Landfill 8 RAP requirements.

E.1.2.3 Fill Site 6 (Appendix A-3)

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at FS 6 during the First and Second Quarters 2006.

No RAP-specified cleanup levels were exceeded during either the First or Second Quarters 2006 within the FS 6 wells sampled.

TPHd was detected within well LF6GW103 at a concentration of 76 µg/L during the Second Quarter 2006. TPHd continues to remain below the RAP cleanup levels to date within FS 6 monitoring wells.

No OCPs or PCBs were detected within FS 6 monitoring wells during the First and Second Quarters 2006. However, aldrin was detected in monitoring well LF6GW103 in the Third Quarter 2005 at a concentration of 0.05 µg/L and dieldrin was detected in well LF6GW100 at a concentration of 0.1 µg/L. These levels exceeded the FS 6 RAP-specified cleanup level; therefore, OCP concentrations will continue to be evaluated during future sampling events.

No PAHs were detected in FS 6 wells during the First and Second Quarters 2006.

Several new high or low concentrations of dissolved metals were detected within FS 6 samples during the First Quarter 2006. However, the majority of the metal concentrations detected were generally within historical ranges.

Dissolved oxygen, nitrate, nitrite, sulfate, sulfide, and TOC were measured during the First and Second Quarters 2006. At many locations, these parameters were only measured for the first or

second time, therefore these parameters should continue to be monitored during future sampling events to identify apparent trends.

E.1.2.4 Battery Howe/Wagner (Appendix A-4)

Groundwater elevations, gradients, and flow directions during First and Second Quarters 2006 are consistent with historical values and interpretations. The five Battery Howe/Wagner monitoring wells were sampled and analyzed during the First and Second Quarter 2006 without any significant findings. The majority of dissolved metals and general chemistry results were within the range of previously detected concentrations for Battery Howe/Wagner monitoring wells and are not considered significant.

The VOCs results for the First Quarter 2006 are similar to historical trends with low levels of tetrachloride and chloroform detected in monitoring well BHWGW01 and 1,1-DCE detected in monitoring well HWGW100. In general, the majority of compound concentrations detected were within historical ranges. Analytes that were outside of historical bounds can generally be attributed to natural fluctuations.

E.1.2.5 Building 1349 Area (Appendix A-5)

Nine Building 1349 monitoring wells were sampled during the First Quarter 2006. Monitoring well 1349MW100 was the only well sampled during the Second Quarter 2006.

The Building 1349 Area CAP was finalized and submitted to the stakeholders in February 2006. Groundwater sampling at the Building 1349 Area will be conducted in accordance with the CAP when the CAP is implemented. The recommended corrective actions for the Building 1349 Area are detailed in the CAP and are summarized in Section 3.0.

TPHg was detected above its Building 1349 Area CAP cleanup level during the First Quarter 2006 at 1349MW100. TPHd was also detected within this well above its Building 1349 Area CAP cleanup level during both the First and Second Quarters 2006. TPHd concentrations continue to exceed groundwater cleanup levels within monitoring well 1349MW100, and both TPHg and TPHd continue to fluctuate significantly from one sampling event to the next at this location.

OCPs continue to be detected within monitoring well 1349MW100. During the First Quarter 2006, alpha-chlordane and gamma chlordane were detected at new high concentrations. Additional detections included 4,4'-DDD, aldrin, delta-BHC, dieldrin, heptachlor, and heptachlor epoxide, which were detected within the historical concentration ranges for these compounds at this well. During the Second Quarter 2006, heptachlor epoxide was detected at a new high concentration, and 4,4'-DDT, aldrin and alpha-chlordane were also detected. Some of these detected concentrations exceeded both the concentrations of OCPs previously detected in 1349MW100, and the applicable cleanup levels as outlined in the CAP (BBL, 2006). OCPs have

been detected in the past in monitoring wells 1349MW03R, 1349MW101, and 1349MW102, which are generally downgradient of monitoring well 1349MW100. However, OCPs have not been detected within any of these wells for at least five sampling events.

Dissolved arsenic, iron, and manganese have been detected in monitoring well 1349MW100 samples at concentrations generally higher than within the other Building 1349 monitoring wells. Arsenic is commonly found in the natural environment and is often present in combination with iron and manganese oxides. Arsenic has also been detected at elevated concentrations in monitoring well 1349MW105, although not in association with elevated concentrations of manganese or iron.

Arsenic, iron and manganese are generally more soluble and mobile under reducing conditions. A reducing environment likely exists within 1349MW100 due to the degradation of petroleum hydrocarbons present at this well. This chemical process is likely contributing to the elevated levels of dissolved arsenic, iron and manganese within 1349MW100. Future detections and concentration trends of these compounds will continue to be monitored and evaluated.

Building 1349 Area monitoring wells will continue to be sampled in accordance with the Building 1349 Area CAP, and results evaluated against the Building 1349 Area CAP cleanup levels.

E.1.2.6 Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells (Appendix A-6)

No significant trends were observed during the First and Second Quarters 2006. The sampling frequency at Fill Site 1 and Landfill 2 has been reduced to annual (Tables 1A and 1B) until a decision document is approved. Due to four consecutive quarters of non-detect results, monitoring wells 100GW101 and 104GW101 were removed from the sampling schedule following the First Quarter 2004. Abandonment of these wells will be proposed in the pending Group II Mini-CAP document.

Annual analysis of 22 dissolved metals will continue to be conducted at El Polin Spring for the purpose of comparing surface water analytical results to nearby groundwater results and evaluating the potential for human exposure. No additional changes to the groundwater monitoring program have been proposed at this site.

E.1.2.7 Landfill E (Appendix A-7)

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at Landfill E during the First and Second Quarters 2006.

During the First Quarter 2006, the samples collected from DAEGW101 and DAEGW104 had a reported concentration of TPHd of 65 and 54 µg/L, respectively. TPHd was also detected at

similar concentrations in samples from DAESP03. TPHd was previously detected in DAEGW104 in the First Quarter 2005, but was not previously present at DAEGW101. No other TPH was detected above the laboratory reporting limit in any other samples collected from Landfill E monitoring wells during the First Quarter 2006.

No VOCs, PAHs, OCPs, or PCBs were detected within any of the groundwater samples collected from Landfill E monitoring wells during the First Quarter 2006.

A FFS has been prepared for Landfill E. The reduction to annual sampling at monitoring wells DAEGW03 through DAEGW08 until a Landfill E RAP have been finalized was approved by the stakeholders prior to First Quarter 2004. Sampling will be performed per the RAP once it has been finalized and implemented.

E.1.2.8 Landfill 4 (Appendix A-8)

General chemistry parameters at the site have remained relatively stable.

One PCB aroclor 1260 was detected above the RAP cleanup level in the LF4GW104, QC duplicate sample in the Third Quarter 2005. No other PCB detections have occurred in any LF 4 groundwater samples.

Dissolved metals concentrations at the site have remained relatively stable The potential for increasing or decreasing dissolved nickel concentrations within monitoring wells LF4GW103 and LF4GW104 will continue to be evaluated in future monitoring events, in accordance with the RAP.

With the exception of beta-BHC, PCB aroclor 1260, and nickel, no RAP-specified cleanup levels have been exceeded within LF 4 monitoring well samples to date.

No significant trends were observed in the samples collected during the First and Second Quarters 2006.

E.1.2.9 Fill Site 5 (Appendix A-9)

No PCBs were detected above their respective RAP-specified cleanup levels within any FS 5 or associated Building 1349 Area monitoring wells during the First or Second Quarters 2006.

Several OCP, PAH, and TPH compounds were detected in the upgradient Building 1349 monitoring well 1349MW100 samples during the First and Second Quarters 2006. FS 5 RAP cleanup levels do not apply to upgradient Building 1349 monitoring wells.

Per the FS 5 RAP, the reduction to semi-annual sampling for VOCs and PAHs within FS 5 monitoring wells (LF5GW100 through LF5GW104) was approved in the Fourth Quarter 2004 because no RAP-specified cleanup levels have been exceeded in at least four quarters for any of

these compounds within any FS 5 monitoring well samples. In addition, TPH, PAHs, VOCs, PCBs, chlorinated herbicides, general chemistry parameters, TDS, and dissolved metals met the post-remediation groundwater monitoring requirements and cleanup levels from the FS 5 RAP within 1349MW03R, 1349MW101, and 1349MW102 in the First Quarter 2006. Subsequently, the Trust requested cessation of these analytical compounds from the Groundwater Monitoring Program at FS 5/Building 1349 (including 1349MW03R, 1349MW101, and 1349MW102), prior to the Second Quarter 2006. These three wells will however be monitored in the future under the Building 1349 Area CAP upon its finalization.

E.1.2.10 Building 231/207 Area (Appendix A-10)

All Building 231/207 Area monitoring wells and piezometers were sampled during the First Quarter 2006 and monitoring well 231MW09 was the only monitoring well purged and sampled during the Second Quarter 2006.

The Draft Building 231/207 CAP was submitted to the stakeholders in 2005 for regulatory review. The CAP-specified cleanup levels have been compared to the First and Second Quarter 2006 groundwater data and are posted on Tables A-10-2, A-10-3, A10-5, and A-10-6. TPHg, TPHd, TPHfo, benzene, ethylbenzene, total xylenes, dissolved arsenic, lead and nickel were all detected at concentrations greater than their CAP-specified cleanup levels during the First Quarter 2006. Monitoring wells 231GW09, 231GW10, 231GW13, 231GW21, 231GW22, 231GW25, and piezometers 231PZ01 through 231PZ04 all had at least one detected concentration, of the above contaminants, in excess of CAP-specified cleanup levels. Specific contaminant levels and groundwater exceedances are discussed in detail in Section 6.0 of Appendix A-10.

Concentrations of TPH and VOCs within Building 231/207 Area monitoring wells continue to fluctuate within historical bounds.

E.1.2.11 Building 1065/1027 Area (Appendix A-11)

Dissolved arsenic and iron concentrations were observed to drop during the Fourth Quarter 2004 within 1065PZ1A and 1065PZ2A, which are located downgradient of the interim removal action conducted in November 2003. The drop in concentration during the Fourth Quarter 2004 was believed to be a result of the interim remedial action. However, a rebound in arsenic and iron concentrations within these piezometers is currently occurring. Dissolved arsenic and iron concentrations will continue to be monitored downgradient of the interim removal action and new trends will be identified as they become apparent.

Potential changes to the groundwater flow patterns and any potential impact to contaminant migration will continue to be evaluated in future quarterly monitoring events.

Groundwater sampling frequency was reduced to annual within all Building 1065/1027 Area wells and piezometers, except 1065PZ1A, 1065PZ1B, 1065PZ2A, 1065PZ4A, 1065PZ5AR, 1065MW9A, 1065MW9B, 1065MW101, 1065MW102, and 1047MW101 until the Building 1065/1027 Area CAP is approved and implemented, at which time the groundwater monitoring program will be conducted in accordance with the CAP.

E.1.2.12 Mini-CAP Areas (Appendix A-12)

Groundwater cleanup levels for benzene, 1,2-dichloroethane and chromium were exceeded on five occasions, all from groundwater sample concentrations collected from monitoring well 1213GW101. In both the First and Second Quarters 2006, benzene was detected in monitoring well 1213GW101 at concentrations of 1.5 and 8.5 µg/L, respectively. These concentrations exceed the groundwater cleanup level of 1 µg/L. The groundwater cleanup level also was exceeded during the First and Second Quarters 2006 for 1,2-DCA, which was detected at concentrations of 5.8 to 8.9 and 6.6 to 9.6 µg/L, respectively, in the primary and duplicate samples from monitoring well 1213GW101.

During the First Quarter 2006, TPHg was detected below the 770 µg/L cleanup level within 1213GW101 and 1221GW102 at 230 and 87 µg/L, respectively. The concentration of TPHg decreased to 68 µg/L in monitoring well 1213GW101 during the Second Quarter 2006. During the First Quarter 2006, TPHd was detected below the 880 µg/L cleanup level within monitoring wells 1213GW101, 1221GW102 and 1260GW102, at concentrations of 61, 53, and 88 µg/L, respectively. The TPHd concentration in monitoring well 1213GW101 decreased from 61 µg/L to <50 µg/L during the Second Quarter 2006. MTBE was detected below the 13 µg/L cleanup level during the First Quarter 2006 in monitoring wells 514AGW101 and FM14EX07GW102, at concentrations of 3.6 and 2.3 µg/L, respectively.

During the Second Quarter 2006, chromium was detected in the primary sample from monitoring well 1213GW101 at a concentration of 54 µg/L, which exceeds the cleanup level of 50 µg/L.

TPH, BTEX, MTBE, VOCs, and dissolved metals analysis will be conducted during future sampling events to develop a baseline of data and evaluate concentration trends for the Mini-CAP Area monitoring wells.

E.1.2.13 Nike Missile Facility (Appendix A-13)

Groundwater elevations, gradients, and flow directions during the First and Second Quarters 2006 are consistent with historical values and interpretations. NDMA was detected above laboratory limits within three of the five Nike Missile Facility monitoring wells sampled during the First Quarter 2006. All detected concentrations of NDMA exceed the EPA's Preliminary Remedial Goal (PRG) for tap water of 0.0013 µg/L, but none of the detected results exceed the CDHS notification level of 0.01 µg/L.

NDMA will continue to be sampled within all Nike Missile Facility monitoring wells during the first and third quarter sampling events to establish a baseline of data. The addition of field QC blanks for NDMA will be added to this program in the First Quarter 2007 in order to comply with the QAPP and guard against unknown field contamination of the sample. A RAP is currently being prepared for the Nike Missile Facility and a revised groundwater monitoring plan will be implemented, in accordance with the RAP, when it is approved by the DTSC, RWQCB, and other stakeholders. There are no other proposed changes to the groundwater monitoring program at this site.

E.1.2.14 Baker Beach Disturbed Area 3 (Appendix A-14)

Chromium was detected above its RAP-specified cleanup level of 50 µg/L within BB3SW102 during the First and Second Quarters 2006. No other analytes were detected at concentrations above their respective RAP cleanup levels during either the First or Second Quarters 2006.

At DTSC's request, an additional piezometer (BB3PZ102) and seep location (BB3SW104) are also now sampled. No significant trends were identified during the First and Second Quarters 2006 at BBDA 3. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP.

E.1.2.15 Landfill 10 (Appendix A-15)

MTBE was detected for the fifth time in monitoring well LF10GW100 during the First Quarter 2006 at a concentration of 2.1 µg/L. However, MTBE has never been detected above its Drinking Water Cleanup Level of 13 µg/L, as listed in the Cleanup Levels Document (EKI, 2003), within LF10GW100 and therefore, these detections do not appear to be significant.. Additionally, clear trends in MTBE concentrations or geographic distribution have not been identified and this detection may not represent an impact to groundwater from Landfill 10. No other significant trends or observations were identified at Landfill 10 during the First and Second Quarters 2006.

Monitoring well LF10GW02 and seep LF10SP100 were not sampled during either the First or Second Quarters 2006 due to overgrown vegetation and health and safety issues. These locations will be sampled following a vegetation clearing effort by the Trust.

The *Five Year Review and Final Investigation Report for Landfills 8 and 10* (FYR) was submitted to the regulatory agencies and RAB in January 2004. The FFS for Landfills 8 and 10 has been prepared. Additionally, the Trust is currently preparing a RAP and designing new remedial actions for the two landfill sites. The RAP is scheduled to be completed in 2007.

E.1.2.16 Commissary/PX Area (Appendix A-16)

Dissolved copper was detected at a new high concentration of 3.1 µg/L within the sample collected from 600GW108. Dissolved nickel was detected at a new high concentration of 8.3 µg/L within the sample collected from 610GW103. These detections were the only exceedances of the Commissary/PX Area cleanup levels for dissolved metals during the First and Second Quarters 2006.

Total aluminum, calcium, chromium, iron, lead, magnesium, nickel, potassium and sodium, were all detected at new low concentrations within both seeps during the First Quarter 2006. Additionally, zinc was detected at a new low concentration within surface water seep 610SP01, and manganese was detected at a new low concentration within surface water seep 610SP02. The majority of total metals appear to be decreasing in concentration. Specific trends will be identified in future monitoring events as they become apparent.

No PAHs, VOCs, MTBE, or TPH compounds were detected above their applicable cleanup levels during either the First or Second Quarters 2006. No other significant findings or data trends were observed during either the First or Second Quarters 2006.

The Revised Final Commissary/PX Area CAP was approved by the RWQCB in June 2006 and Phase I of CAP implementation is currently underway. Once Phase I of the CAP is completed, groundwater monitoring will be conducted in accordance with the Revised Final CAP.

E.1.2.17 Baker Beach Disturbed Areas 1 and 2A (Appendix A-17)

BBDAs 1 and 2A were added to the Presidio-Wide Groundwater Monitoring Program beginning Second Quarter 2006. No groundwater has been encountered at BBDAs 1 and 2A, however, two piezometers (BBDA1PZ100 and BB1PZ101) monitor a fresh water seep at BBDA 1 and one seep location is monitored at BBDA 2A (BB2ASW100).

Due to limited data collected to date, no significant trends were identified during the Second Quarters 2006 at BBDAs 1 and 2A. Future detections and trends will continue to be monitored and evaluated in accordance with the RAP, which is scheduled to be completed in 2007.

SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
PRESIDIO-WIDE GROUNDWATER MONITORING PROGRAM
Presidio of San Francisco, California

1.0 INTRODUCTION

This Semi-Annual Groundwater Monitoring Report for the First and Second Quarters 2006 of the Presidio-Wide Groundwater Monitoring Program has been prepared by Treadwell & Rollo, Inc. (Treadwell & Rollo) for The Presidio Trust (Trust). During the First and Second Quarters 2006, 17 sites at the Presidio of San Francisco (Presidio) were included in the groundwater monitoring program, as shown on Figure 1. Although the Presidio is currently under the jurisdiction of the Trust and the National Park Service (NPS), the Trust is managing the Presidio-wide Groundwater Monitoring Program.

This report describes the groundwater elevation monitoring and sampling methods used, summarizes the laboratory analytical procedures and results, and presents the results of the quality assurance and quality control (QA/QC) and data validation activities for samples collected during the First and Second Quarters 2006. This report also summarizes historical sampling data previously collected by others. The groundwater monitoring, laboratory, and data validation methods and procedures used by others during historical sampling events have been discussed in previous quarterly groundwater monitoring reports (Montgomery Watson, 1996c, 1999a-n, 2000; Treadwell & Rollo, 2001b, 2002b, 2002d, 2002f, 2002g, 2002h).

The Trust worked with the United States Environmental Protection Agency (EPA), California Environmental Protection Agency, Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board, San Francisco Bay Region (RWQCB), and Restoration Advisory Board (RAB) representatives to develop the Cleanup Levels Document. The *Development of Presidio-Wide Cleanup Levels for Soil, Sediment, Groundwater, and Surface Water* (Cleanup Levels Document) summarizes the derivation of human health and ecological cleanup for soil, sediment, groundwater, and surface water, and the development of soil background metal concentrations at the Presidio (Erler & Kalinowski, Inc. [EKI], 2002). The document also presents the proposed methodology for determining Presidio-specific cleanup levels based on the protection of human health and ecological receptors for chemicals that may potentially be encountered in soil, sediment, and water at the Presidio (EKI, 2002). These cleanup levels were developed to be applied to new decision documents for chemical release sites within the Presidio.

Cleanup of petroleum program sites, such as the Commissary/Post Exchange (PX), must adhere to Site Cleanup Requirements (SCRs), per *Order No. R2-2003-0080, Revised Site Cleanup Requirements and Rescission of Order No. 91-082 and Order No. 96-070* (RWQCB, 2003). This Order requires that the Presidio-Wide Quarterly Groundwater Monitoring Program report monitoring activities and findings, and publish chemical concentration plume maps of appropriate contaminants of concern semi-annually. This report is intended to comply with the requirements of the Order.

1.1 Report Organization

This report is organized as described below.

- The Executive Summary presents a brief, concise synopsis of the most significant changes to the monitoring program and any significant findings, observations, and recommendations.
- The Main Body of the report presents the project background, the geologic and hydrogeologic setting, the groundwater monitoring procedures, the laboratory analyses, and the QA/QC procedures and findings. The main body of the report includes a site location figure and tables summarizing monitoring plans, sampling and analytical procedures and methods, and data validation procedures.
- Appendix A presents sections for each of the areas included in the program. Each section describes the site background and site-specific geologic and hydrogeologic setting, presents current and historical sampling results, and provides recommendations for modifications in future monitoring events. Each site section contains site-specific figures, tables summarizing analytical results, and monitoring well purge records.
- Appendix B contains completed equipment calibration forms.
- Appendix C contains groundwater-level measurement logs.
- Appendix D contains the laboratory analytical quality control (QC) reports for the First and Second Quarters 2006 prepared by DataVal, Inc. (DataVal), the project data validation firm. Appendix D is included in electronic form on a compact disk (CD).
- Appendix E contains Curtis & Tompkins, Ltd. (Curtis & Tompkins) laboratory analytical data reports. Curtis & Tompkins was the designated primary laboratory for the First and Second Quarters 2006. Appendix E is included in electronic form on a CD.

- Appendix F contains Columbia Analytical Services (CAS) laboratory analytical data reports. CAS was the QC laboratory designated to analyze the QC duplicate samples for the First and Second Quarters 2006. Appendix F is included in electronic form on a CD.

1.2 Field Sampling Plan

The groundwater monitoring activities documented in this report were performed in accordance with the *Field Sampling Plan, Presidio Groundwater Monitoring Project, Presidio of San Francisco, San Francisco, California* (FSP) (Treadwell & Rollo, 2001a) and the *Presidio-wide Quality Assurance Project Plan Sampling and Analysis Plan* (QAPP) (Tetra Tech, 2001). The FSP initially identified the groundwater elevation monitoring and sampling schedules, well locations, sampling procedures, and proposed analytical test methods. Currently, groundwater elevation monitoring and sampling schedules, well locations, sampling procedures, and proposed analytical test methods are identified on a quarterly basis in Table 1 of this report. Table 1 is submitted to the stakeholders for review and approval prior to sampling during each quarterly monitoring event.

Standard operating procedures (SOPs) were presented for required monitoring tasks and for optional tasks such as well abandonment, which may be performed within the scope of the groundwater monitoring program. The *Base-wide Groundwater Monitoring Plan* (BGMP) (Montgomery Watson, 1996c) and site-specific corrective and remedial action plans (CAPs and RAPs) were also consulted in preparation of this report.

Modifications to the FSP may be required if the scope of work is modified, or if there are substantial revisions to the QAPP. If modifications to the FSP are required, a letter will be prepared which will include a brief discussion of the proposed changes and copies of revised tables and figures. The letter will be submitted to the NPS and appropriate regulatory agencies for review and comment. Minor adjustments may be made to the monitoring program depending on field conditions, and those changes will be documented in field logs and reported in the semi-annual reports.

1.3 Groundwater Monitoring Objectives

The general objectives of the Presidio-wide Groundwater Monitoring Program, as presented in the FSP, are as follows:

- Monitor the lateral and vertical extent of groundwater contamination.
- Track contaminant concentration and migration to help evaluate impacts to potential beneficial uses of groundwater.

- Provide data on contaminant concentration and migration needed for studies to evaluate potential exposure pathways to human and ecological receptors.
- Improve understanding of the Presidio geology and hydrogeology.
- Validate, optimize, and evaluate the effectiveness of groundwater remedial measures.
- Evaluate whether remedial objectives have been met.
- Provide the information necessary to establish and update long-term monitoring strategies.
- Provide groundwater monitoring reports with defensible data in accordance with the QAPP, SOPs, site-specific remedial plans and decision documents, and applicable regulatory agency requirements.

Site-specific monitoring objectives are identified in the site-specific sections presented in Appendix A.

2.0 BACKGROUND

The United States Department of Defense, Department of the Army (Army) operated the Presidio as a military base until 1994, when the Army closed this base and transferred the Presidio's administrative jurisdiction to the NPS. As part of the Army's responsibilities under base closure legislation, the Army initiated certain actions to address environmental conditions at the Presidio, including instituting the BGMP. The Army retained Montgomery Watson to prepare the BGMP and to conduct the groundwater monitoring program.

The Trust was established following passage of the Presidio Trust Act in 1996. The Trust negotiated with the Army to assume the Army's environmental cleanup responsibilities in order to expedite the environmental remediation efforts. The Trust retained Montgomery Watson to continue the Groundwater Monitoring Program through the Third Quarter 2000 and retained Treadwell & Rollo to perform the Presidio-wide Groundwater Monitoring Program beginning with the Second Quarter 2001.

3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING

Tectonic activity in the San Francisco Bay Area, and the Presidio specifically, has resulted in an irregular topography of near-surface and surficial bedrock (referred to as the Franciscan Formation). Throughout the Presidio, the Franciscan Complex consists mostly of serpentinite that is typically overlain by relatively permeable units of poorly consolidated or unconsolidated sediments. These units are defined as (from oldest to youngest): the Merced Formation, the Colma Formation, the West Valley Clay, and dune sand.

The Merced Formation is a discontinuous unit, composed primarily of clay with low hydraulic conductivity. The Colma Formation overlies the Merced Formation, and overlies the Franciscan Formation bedrock in areas where the Merced is absent. The Colma Formation consists of horizontally bedded, fine-grained, slightly silty sand. A local, discontinuous clay deposit of unknown origin, referred to as the West Valley Clay, has been observed in a layer up to 30 feet thick overlying the Colma Formation. Dune sands are the most recent continuous unit deposited across the Presidio. Dune sands generally overlie the Colma Formation, but may also overlie the Franciscan, Merced, or West Valley Clay where erosion of the Colma Formation has occurred. The dune sands are generally well sorted, fine- to medium-grained, and yellow-brown to light gray in color.

Previous investigations have identified three groundwater basins at the Presidio. These basins are the Lobos Creek Groundwater Basin, the Coastal Bluffs Groundwater Basin, and the Marina Groundwater Basin (Figure 1). The Lobos Creek Groundwater Basin includes Lobos Creek, the principle perennial stream at the Presidio. The Marina Groundwater Basin includes the West Valley, Northeastern, and the Crissy Field Groundwater Areas (Montgomery Watson, 1996c). The Coastal Bluffs Groundwater Basin is not subdivided into groundwater areas.

The Lobos Creek Groundwater Basin is underlain by the Franciscan Formation and substantial thicknesses of relatively permeable, unconsolidated units. Several groundwater wells within this basin were used to supply a portion (approximately 10 percent) of the water used for former Presidio operations.

The Marina Groundwater Basin is the largest of the three basins at the Presidio. As mentioned above, this basin includes three groundwater areas, based on their geographic location. The Marina Groundwater Basin is underlain by all of the geologic units identified at the Presidio.

The Coastal Bluffs Groundwater Basin is the smallest of the three groundwater basins and is predominantly underlain by relatively impermeable serpentinite rock (Franciscan Formation) with minor amounts of overlying permeable materials. Groundwater yields in this basin are expected to be extremely low.

The BGMP was prepared in 1996 and has been supplemented by subsequent site-specific investigations. Summaries of geologic and hydrogeologic conditions encountered at each sampling area are presented in Appendix A.

4.0 GROUNDWATER MONITORING

The scope of field work for this report included collecting groundwater elevation measurements and samples from groundwater monitoring wells, piezometers, and seeps or springs at 17 areas at the Presidio (Figure 1). Tables 1A and 1B identify the elevation monitoring, sampling, and analyses schedules for wells, piezometers, seeps, and springs at each area for the First and Second Quarters 2006, respectively. The 17 areas are:

1. Building 900s Area
2. Landfill 8
3. Fill Site 6
4. Battery Howe/Wagner
5. Building 1349 Area
6. Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells
7. Landfill E
8. Landfill 4
9. Fill Site 5
10. Building 231/207 Area
11. Building 1065/1027 Area
12. Mini-CAP Areas
13. Nike Missile Facility
14. Baker Beach Disturbed Area 3
15. Landfill 10
16. Commissary/PX Area
17. Baker Beach Disturbed Areas 1 and 2A

4.1 Groundwater Elevation Monitoring

On 6 March and 22 May 2006, groundwater elevation measurements were collected at monitoring wells, piezometers, and seeps and were evaluated for flow at 203 and 204 locations, respectively. Tables 2A and 2B summarize the groundwater elevation measurements collected during the First and Second Quarters 2006, respectively. Groundwater elevations were measured

using a Slope Indicator model #51453 or a Solinst model #101 water level meter. Copies of all field equipment calibration forms are included in Appendix B. A minimum of three measurements was taken at each well and recorded on the groundwater elevation log, as described in the SOPs. Copies of the groundwater-level measurement logs are included as Appendix C. The water level meters were decontaminated after each use by spraying them with an Alconox detergent solution, then rinsing with potable water, in conformance with the SOPs.

During the First Quarter 2006 groundwater elevation monitoring, one well (HWGW102) was found to be dry. Three groundwater monitoring wells (UBR01GW01, 1065PZ6A, 1065PZ6B) were proposed for elevation monitoring during the First Quarter 2006, but were unable to be located due to obstructions. Additionally, Commissary/PX Area seeps 610SP01 and 610SP02 were underwater during the First Quarter 2006 sampling event. This phenomenon occurs when sand bars naturally accumulate along the entrance to the Crissy Field Marsh. The presence of the sand bars limit the tidal influence within the Crissy Field Marsh and causes the low tide water elevation in the marsh to be higher than the elevation in the San Francisco Bay. The conditions at these locations are identified in Table 2A.

During the Second Quarter 2006 groundwater elevation monitoring, four wells or piezometers (HWGW102, BB2ASW100, BB3PZ101, and BB3PZ102) were found either to be dry or to contain an insufficient amount of water to measure (i.e., water was trapped in the well end-cap and therefore was not representative of the aquifer). Five groundwater seeps (LF5SP100, DAESP03, 610SP01, 610SP02 and BB2ASW100) were not flowing at the time of the groundwater elevation survey. Five groundwater monitoring wells, seeps, or piezometers (UBR01GW01, NKGW04, 1065PZ6A, LF10GW02, and LF10SP01) were proposed for elevation monitoring during the First Quarter 2006, but could not be located. The conditions at these locations are identified in Table 2B.

4.1.1 Groundwater Elevation Monitoring at Tidally Influenced Wells

During the First Quarter 2006, low and high tides were predicted to be at 11:12 AM and 6:48 PM on 6 March 2006, respectively. Observed low tide on 6 March 2006 was at 11:08 AM with a magnitude of 0.8 feet above Presidio Lower Low Water (PLLW). Observed high tide on 6 March 2006 was at 7:06 PM with a magnitude of 6.41 feet above PLLW. The First Quarter 2006 predicted and observed tidal times and magnitudes are presented in the notes on Table 2A.

During the Second Quarter 2006, low and high tides were predicted to be at 8:12 PM and 11:42 AM on 22 May 2006, respectively. Observed low tide on 22 May 2006 was at 8:06 PM with a magnitude of 0.79 feet above PLLW. Observed high tide on 22 May 2006 was at 11:36 AM with a magnitude of 5.6 feet above PLLW. The Second Quarter 2006 predicted and observed tidal times and magnitudes are presented in the notes on Table 2B.

During the First Quarter 2006, depth to groundwater measurements were collected between 12:34 and 2:00 PM on 6 March 2006 at the Building 900s and Commissary/PX Areas, which the Trust has determined are tidally influenced. Figure 2A shows graphical tide plots for the Golden Gate Tidal Station on 6 March 2006.

During the Second Quarter 2006, depth to groundwater measurements were collected between 2:25 and 3:25 PM on 22 May 2006 at the Building 900s and Commissary/PX Areas, which the Trust has determined are tidally influenced. Figure 2B shows graphical tide plots for the Golden Gate Tidal Station on 22 May 2006.

Varying degrees of tidal lag may exist at site wells, causing groundwater elevations within monitoring wells to vary and to not necessarily be synchronized to the tidal schedule. The "tidal lag" is the length of time between a tidal extreme and the maximum influence measured in a well. The distance inland from the nearest tidally influenced surface water body is used to determine the tidal lag. In a homogeneous aquifer, the tidal lag time should be directly proportional to the distance from the surface water body. Variations in the tidal lag may be due to aquifer heterogeneity or the presence of man-made structures. At Crissy Field, the shallow aquifer may be hydraulically connected to the tidal marsh, whereas the intermediate and deeper aquifer may be hydraulically connected to the San Francisco Bay, though these relationships have not been specifically characterized.

4.2 Groundwater Sampling

The equipment and methods described in the FSP are summarized below. Groundwater samples were collected in laboratory-supplied sample containers, sealed, labeled, and placed into ice chests containing a sufficient volume of ice to maintain a temperature of 4.0 degrees Celsius (^{O}C) for transport to the offsite analytical laboratories, in accordance with the methods described in the FSP. All samples were documented with chain-of-custody protocols, as described in the chain-of-custody SOP. The site-specific sections in Appendix A present details of well, piezometer, and seep sampling.

During the First Quarter 2006, three groundwater sampling crews purged and/or sampled 171 wells, piezometers, and groundwater seeps between 7 March and 24 March 2006. Two of the monitoring wells (HWGW102, and BB3GW101) proposed for sampling were either dry or did not contain a sufficient amount of water for sampling during the First Quarter 2006. Three monitoring wells, seeps, or piezometers (1065PZ6A, LF10GW2, and LF10SP01) were inaccessible, and were not sampled.

During the Second Quarter 2006, three groundwater sampling crews purged and/or sampled 44 wells, piezometers, and groundwater seeps between 23 May and 25 May 2006. The following monitoring wells, piezometers, and/or groundwater seeps (DAESP03, BB2ASW100,

BB3GW100, BB3PZ101, BB3PZ102, BB3GW100, and HWGW102) were either dry or did not contain a sufficient amount of water for sampling during the Second Quarter 2006. Two monitoring wells or seeps (LF10GW02 and LF10SP01) were not sampled because they were in accessible. Additionally, two seeps (610SP01 and 610SP02) were submerged by the Crissy Field Marsh.

4.2.1 Groundwater Purging Methods and Selection Criteria

The following sections describe the groundwater purging methods and selection criteria that were used during this quarter.

4.2.1.1 Groundwater Purging Methods

Two primary groundwater well purging methods, normal and low flow, were used during the First and Second Quarters 2006 and are described below. Tables 1A and 1B identify the sampling methods that were proposed for each well. If field conditions required any changes from the proposed methods, those changes are described in the site-specific summaries in Appendix A.

Normal – This method involves purging until three borehole volumes of groundwater have been extracted or until groundwater parameters have stabilized, which ever is greater. Table 3 identifies well construction details required to calculate the borehole volumes for each well. Table 4 shows the precalculated volume of water in a 1-foot section of various borehole and casing sizes. For low-yield wells that require slower pumping rates than would be used with the normal method, Tables 1A and 1B identify a modified normal method, which is the same as the normal method except that a maximum purging rate of 0.5 gallons per minute (gpm) is designated. If the well is able to sustain a 0.5 gpm purge rate, well purging is considered complete after groundwater parameters have stabilized. If a well is purged dry using the normal or modified purging methods, the groundwater level is allowed to recharge to within 80 percent of its pre-purging elevation prior to sampling. Additional details on this method are presented in the FSP.

Low Flow – This method involves purging at a rate as low as 0.02 gpm in order to minimize groundwater sample disturbance. Additional details on this method are presented in the FSP.

4.2.1.2 Groundwater Purging Method Selection Criteria

The Trust has determined which purging method to use at each well using the following selection criteria:

1. Whenever possible, wells should be purged using the normal method.

2. To help maintain data comparability, the purging method for a well should remain consistent from quarter to quarter except as noted below.

3. If a well is pumped dry or shows a significant drop in the groundwater elevation using the normal method and requires a slower pumping rate, the modified normal purge method will be used. This change to a slower pumping rate can be made during purging, depending upon groundwater recharge conditions.

4. If a well is pumped dry using the modified normal method and requires a slower pumping rate, the low-flow purge method will be used. This method requires specialized equipment and has the potential to affect data comparability, so changes to this method would only occur with Trust approval prior to future quarterly sampling.

5. When not conflicting with criteria 1 through 4, all wells at a single site screened in the same zone shall be purged using the same method.

4.2.2 Groundwater Sampling Methods

The sampling methods used following purging are described below.

4.2.2.1 Groundwater Sampling Methods After Normal Purging

Following normal purging, groundwater samples were collected using a new disposable bailer, a 2-inch-diameter Grundfos Redi-Flow™ or a peristaltic pump, and decanted into the appropriate laboratory-supplied containers. Monitoring wells that are sampled using either a 2-inch Redi-Flow™ or peristaltic pump may have dedicated tubing associated with them. Dedicated tubing is stored at the Central Magazine in new plastic bags after each use.

4.2.2.2 Groundwater Sampling After Low-Flow Purging

Following low-flow purging, groundwater samples were collected using either a peristaltic pump or a 2-inch Redi-Flow™ pump. Monitoring wells that are sampled using either a 2-inch Redi-Flow™ or peristaltic pump may have dedicated tubing associated with them. Dedicated tubing is stored at the Central Magazine in new plastic bags after each use.

4.2.2.3 Sampling at Seeps

Seven seep and fixed monitoring locations were identified for sampling as part of this program during the First and Second Quarters 2006 (Tables 1A and 1B). Because spring and seep locations can change over time, the sample locations were initially identified by the Trust.

Three Baker Beach Disturbed Area 3 (BBDA 3) fixed surface water seep monitoring points, BB3SW100, BB3SW101, and BB3SW102, were installed on 8 and 23 May 2005 at depths of 2.5, 3.0, and 2.5 feet bgs, respectively. The fixed monitoring points are purged prior to sampling, in accordance with the 'modified' method of sampling described in Section 4.2.2.1 above.

Seven seep and/or fixed monitoring point samples (EPSP01, LF5SP100, 610SP01, 610SP02 and BB3SW100 through BB3SW102) were collected during the First Quarter 2006, in accordance with procedures presented in the FSP. Seep LF10SP01 was inaccessible due to overgrown vegetation, and therefore no samples were collected at this location during the First Quarter 2006.

Four seep and/or fixed monitoring point samples (EPSP01, BB3SW101, BB3SW102 and BB3SW104) were collected during the Second Quarter 2006, in accordance with procedures presented in the FSP. Five seeps (610SP01, 610SP02, DAESP03, BB2ASW100, and BB3SW100) were not flowing during the Second Quarter 2006 and were not sampled. Additionally, seep LF10SP01 was inaccessible due to overgrown vegetation and therefore no samples were collected at this location during the Second Quarter 2006.

During the First and Second Quarters 2006, all seep samples were analyzed for dissolved metals and total metals, as requested by the DTSC.

4.3 Sample Preservation, Handling, and Transportation

Samples were collected in laboratory-supplied sample containers, sealed, labeled, and placed into an ice chest containing a sufficient volume of ice to maintain a temperature of 4.0 ^{O}C (plus or minus 2.0 ^{O}C) for transport to the offsite analytical laboratories, in conformance with procedures presented in the FSP. Temperature blanks were included in coolers for measurement by the laboratory upon receipt.

4.3.1 Sample Labels and Chain-of-Custody Documentation

Sample labels for each container were preprinted on adhesive paper prior to beginning sampling operations. Prior to sampling, each field team was designated a number (e.g., 1 through 4 in the case of four sampling teams) for the duration of the sampling event. The samples were identified according to the numbering scheme described in the FSP, with the following modifications.

- The FSP specified that trip blanks be identified as TB and the date. When multiple trip blanks were generated by different sampling crews on the same date, the number assigned to the field crew collecting the sample (1, 2, 3, or 4) and a letter (i.e., A, B, C, etc.), indicating which sample of the day it was for that team, were added to the sample identification to ensure that all trip blanks had unique identifications. For example, trip blank TB0524063A was the first trip blank collected on 24 May 2006 by field crew number 3.

- The FSP specified that duplicate samples be identified as duplicate (DUP) and the date. When multiple duplicate samples were generated by different sampling crews on the same date, the same labeling methodology described above for trip blanks was applied to the duplicates. The number assigned to the field crew collecting the sample and a letter (i.e., A, B, C, etc.), indicating which sample of the day it was for that team, were added to the sample identification to ensure that all duplicates had unique identifications. For example, duplicate sample DUP0523063A was the first duplicate sample collected on 23 May 2006 by field crew number 3.

After labeling, each sample's requested laboratory analyses were recorded on individually numbered triplicate chain-of-custody forms. The sample coolers and chain-of-custody forms were kept in the possession of the samplers or in a secure, locked location prior to pickup by the laboratory courier.

Several samples were incorrectly labeled by the field team during the First and Second Quarters 2006. All sample login summaries are reviewed as samples are received by the laboratories and changes to sample identifications are typically documented in laboratory reports (Appendices E and F). All samples incorrectly labeled were revised during sample login procedures and none of the changes appear to have impacted any of the sample results. Samples incorrectly labeled and subsequently revised are detailed below.

First Quarter 2006

- Samples 600GW102 through 600GW104 were incorrectly identified as G00GW102 through G00GW104. The sample identification was corrected and a new sample login was sent.
- The initial COC did not include analysis of SVOCs for sample DAEGW07. This analysis was subsequently added.
- Sample 1065MW11B was incorrectly identified as 1065PZ11B. The sample identification was corrected and a new sample login was sent.

- No analyses were indicated on the COC for sample TB0320063A. The login was corrected to indicate analysis of VOCs only.

Second Quarter 2006

- A trip blank (TB0523063A) was submitted for SDG 187020, however there were no VOC analyses associated with any of the samples in the SDG and the analysis for the trip blank was canceled.

The field team was instructed on sample identification QA/QC procedures prior to the next Second Quarter 2006 sampling event and will be reminded prior to the next sampling event. Laboratory login summaries will continue to be reviewed by Treadwell & Rollo as samples are collected and submitted to the laboratory and any discrepancies will be corrected.

4.3.2 Filtration of Groundwater Samples for Metals Analyses

Beginning in the Second Quarter 2001 and through the Third Quarter 2002, all groundwater samples collected for dissolved metals analyses were filtered in the field with a 0.45-micron, Clearwater Engineering™ filter prior to being placed in preserved containers. For reasons discussed below in Section 5.4.3.4, a different brand of filter was selected beginning in the Fourth Quarter 2002.

Beginning in the Fourth Quarter 2002, all groundwater samples collected for dissolved metals analyses were filtered in the field with a 0.45-micron, high-capacity polyethersulfone QED Quickfilter™ prior to being placed in preserved containers. The filters were flushed with at least 200 milliliters of sample water prior to collecting the sample, which adheres to the manufacturer's instructions. For wells being analyzed for total dissolved solids (TDS), analyses were also performed using the filtered sample.

At DTSC's request and beginning in the Second Quarter 2003, both dissolved (filtered) and total (unfiltered) metals samples were collected at seep and fixed monitoring point locations. Total metals results are not representative of dissolved metal conditions in groundwater.

All dissolved metals samples collected during the First and Second Quarters 2006 were filtered using QED Quickfilters™.

5.0 LABORATORY ANALYSES

5.1 Analytical Methods

Table 5 lists the types of analyses, analytical methods, sample container types and volumes, preservatives used (if applicable), and the maximum allowable holding times prior to extraction for each analysis. The following carbon ranges were used for total petroleum hydrocarbon (TPH) analyses and are summarized in Table 5.

- TPH as gasoline (TPHg, carbon range C7–C12). This carbon range was specified by the QAPP.
- TPH as stoddard solvent (TPHss, carbon range C7-C12). TPHss analyses were added to the Presidio-wide Groundwater Monitoring Program beginning with the First Quarter 2004 at the request of the Trust. The carbon range for TPHss is not specified in the QAPP. TPHss is a specialized formulation of TPHg and is found in the same carbon range as TPHg. Laboratory quantification for TPHss is achieved by comparing the shape of the analytical chromatogram within the same carbon range as TPHg for a diagnostic combination of spikes.
- TPH as diesel (TPHd, carbon range C12–C24). This carbon range was specified by the QAPP.
- TPH as fuel oil (TPHfo, carbon range C24–C36). No carbon range for TPHfo was specified by the QAPP. At the request of the Trust, TPHfo is qualified by the laboratory using the TPH as motor oil (TPHmo) standard and the QAPP carbon range for TPHmo. This issue is discussed in more detail in Section 5.4.3.1.

Table 6 lists compounds of potential concern (COPC) identified in the QAPP and analytical reporting limits for COPCs in the groundwater monitoring program. Several water quality criteria are summarized in Table 6 for comparison with the laboratory reporting limits. The water quality criteria presented in Table 6 do not necessarily represent cleanup criteria for Presidio sites.

The analytical methods for some metals and polycyclic aromatic hydrocarbons (PAHs) were changed from those identified in the FSP in order to reach the lower reporting limits identified in the QAPP. The following changes, approved by the Trust, were made.

- Twelve metals (antimony, arsenic, barium, beryllium, cadmium, copper, chromium, cobalt, nickel, silver, thallium, and zinc) were analyzed using Environmental Protection Agency (EPA) Method 6020 instead of EPA Method 6010 as proposed in the FSP between the Second Quarter 2001 and the First Quarter 2003. Beginning in the Second Quarter 2003, seven of these metals (arsenic, barium, beryllium,

chromium, cobalt, nickel and zinc) were granted variance by the stakeholders from the QAPP reporting limits and were analyzed using EPA Method 6010.

- PAHs were analyzed using EPA Method 8310 instead of EPA Method 8270 as proposed in the FSP.

Four emergent chemicals (perchlorate, N-nitrosodimethylamine [NDMA], 1,4-dioxane and polybrominated diphenyl ether [PBDE]) were added to the First Quarter 2004 groundwater monitoring event at the request of the RWQCB. As listed on Table 5, analytical methods for the emergent chemicals are:

- Perchlorate, EPA Method 314.0;
- NDMA, EPA Method 1625;
- 1,4-dioxane, using EPA Method 8270C; and
- PBDE, EPA Method 1614.

NDMA was the only emergent chemical analyzed during the First Quarter 2006. No samples were analyzed for the four emergent chemicals during the Second Quarter 2006.

Three new analyses (total organic carbon [TOC], dissolved gases [methane, ethane, and ethane], and arsenic III and V speciation) were added to the Presidio Groundwater Monitoring Program during the Fourth Quarter 2004. Analytical methods used for these new analyses are listed in Table 5 and below:

- TOC, EPA 415.2;
- Dissolved gases, RSK 175; and
- Arsenic III and V speciation, Draft EPA 1632 Modified.

Arsenic III and V speciation and dissolved gases analyses were not conducted during the First and Second Quarters 2006 and will not be included as a part of the Presidio Groundwater Monitoring Program in future quarters as it is no longer required to evaluate groundwater redox conditions at the Site.

5.2 Analytical Data Delivery Methods

The analytical laboratories submitted all analytical reports in paper and electronic formats to Treadwell & Rollo. Both the electronic and paper copies were forwarded to DataVal. DataVal reviewed both the electronic and paper data, and prepared two Data Validation Summary Reports

(QCSR) dated 20 June 2006 (DataVal, 2006a) and 18 August 2006 (DataVal, 2006b). The reports entitled, *Data Validation Summary Report for the First Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA* and *Data Validation Summary Report for the Second Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA*, respectively, are discussed in Section 6.1 and attached as Appendix D.

5.3 Analytical Results

The tables in this report that present new analytical data were generated from laboratory-supplied EDDs, after the EDDs had been validated by DataVal and imported into the project database. Analytical summary tables were prepared for each site and are presented in Appendix A.

5.4 Analytical Data Comparability

One of the goals of this Groundwater Monitoring Program has been to establish standards for groundwater sampling and analytical methods that provide a high degree of data comparability among different wells throughout the Presidio, and between the current and historical data collected at the same well. The primary variables that can influence data comparability are the field methods, sampling methodology, the types of analyses performed, and the analytical methods used by the laboratory. These issues are discussed below.

5.4.1 Field Methods

To assist with data comparability, the FSP established Presidio-wide standard well purging and sampling methods, and criteria for selecting purging methods, as described in Section 4.2. The selection criteria include evaluating the historical purging and sampling methods at a particular well and at other wells within a single site.

To assist with comparability of data collected from direct-reading field instruments, this program has attempted to employ similar methods and instrumentation at wells purged using the same method.

5.4.1.1 Dissolved Oxygen

Dissolved oxygen (DO) results are discussed in the individual site-specific sections in Appendix A. In general, wells purged with the low-flow method used an in-line oxygen probe. Wells purged with the normal method have used a downhole oxygen probe since the Third Quarter 2001. During the Second Quarter 2001, DO was recorded with either a downhole probe or a surface instrument in wells purged with the normal method. The surface instrument generally recorded higher DO concentrations than the downhole instrument because of water turbulence caused by collecting the sample with a bailer.

Beginning in the Second Quarter 2002, in an effort to increase the accuracy and precision of the DO measurements being collected in the field, three additional protocols were added to the existing calibration procedure (i.e. calibrating to 100% air saturation) and measurement method, where appropriate. The first additional protocol involves saturating laboratory-supplied deionized water with sodium sulfite to create a zero milligram per liter (mg/L) DO solution. Following initial calibration to 100% air saturation, each DO probe is placed in the sodium sulfite solution and the measured value is recorded on a calibration record (Appendix B). The recorded values are used to evaluate the accuracy of each DO meter. If the concentration measured by the DO meter is greater than 0.2 mg/L, then the meter is re-calibrated and the concentration is measured again. This process is repeated, as necessary, until the concentration measured by the DO meter is less than 0.2 mg/L.

After the sodium sulfite calibration is complete, each field team measures the DO concentrations simultaneously within a single, randomly selected monitoring well with their respective DO meters. This second protocol is performed once per week throughout each event and the measured values are recorded on a calibration record (Appendix B). The recorded values are used to evaluate the precision between DO meters. If a significant difference between DO meters is observed, a correction factor can be used to ensure that relative values between sampling teams are comparable.

The third protocol involves lowering the down-hole DO meter probe slowly to the middle of the screened interval in each well before recording the DO measurement. This protocol ensures that the relatively disturbed and aerated water near the top of the water column is not measured. This protocol does not apply to wells sampled using the low flow sampling method, because those wells are measured using a flow-through-cell at the surface.

These three additional protocols have produced significantly more stable, and generally lower, DO measurements when compared to historical values.

5.4.2 Analytical Suite

To assist with data comparability, the analytical suite for each well was selected for consistency with previous analyses conducted by others. Additionally, analytes were added to provide greater consistency with the analytical suite for all wells at a site and with wells at adjacent sites.

5.4.3 Analytical Methods

To assist with data comparability, the laboratory analytical methods used, beginning in the Second Quarter 2001, generally remained the same between subsequent quarters, and these methods were similar to most of the methods previously used by others. A significant change from previous TPH analyses was the introduction of carbon ranges specified in the QAPP that

differ from previous ranges. Additional significant changes from previous analytical methods involved PAH compounds and 12 metals, as described in Section 5.1.

5.4.3.1 TPH Analyses

The TPH analytical methods used during the First and Second Quarters 2006 are the same as those used in recent quarterly sampling events. However, historical TPHfo analyses used a carbon range of C_{24}-C_{36}, which the QAPP states should be called TPHmo. During the Second and Third Quarters 2001, TPH within the C_{12}-C_{50} and C_{24}-C_{36} carbon ranges were reported as TPHfo and TPHmo, respectively. Beginning in the Fourth Quarter 2001, TPH within the C_{24}-C_{36} carbon range is reported as TPHfo in order to conform with the reporting convention used prior to the Second Quarter 2001.

It is a standard procedure in this monitoring program to use silica gel cleanup EPA Method 3630A to remove non petroleum-based hydrocarbons in all TPHd, TPHmo, and TPHfo analyses. For Third Quarter 2001, EPA Method 3630A was requested for all TPHd, TPHmo, and TPHfo analyses on the chain-of-custody forms, but the primary laboratory mistakenly did not perform the silica gel cleanup for most of these analyses. For Second Quarter 2002, the QC laboratory mistakenly did not perform the silica gel cleanup for the sample from monitoring well 937GW42. Performing TPH analyses without using a silica gel cleanup to remove non petroleum-based hydrocarbons can lead to elevated TPH concentrations, due to the quantification of naturally occurring hydrocarbons as TPH. This is especially true for sites underlain by material with very high organic content, such as the shallow Bay Mud present in portions of Crissy Field. Previous groundwater monitoring reports have described this issue and presented justification for why the TPH detections in samples run without the silica gel cleanup are not representative of petroleum-based hydrocarbons, and why this data is not being relied upon (Treadwell & Rollo, 2002b, 2002d, 2002f, 2002g, 2002h).

All of the samples with detections of TPHd, TPHfo, and TPHmo, which were not run with the silica gel cleanup, were qualified with an 'NJ' by DataVal. The USEPA National Functional Guidelines for Organic Data Review defines 'NJ' as follows: "The analysis indicates the presence of an analyte that has been 'tentatively identified' and the associated numerical value represents its approximate concentration."

Per Trust request, monitoring well 1047MW100 was sampled for TPH as Stoddard solvent (TPHss) beginning in Fourth Quarter 2003.

5.4.3.2 Xylene Analyses

Beginning in the Fourth Quarter 2001, xylenes were reported as total xylenes in order to conform to the reporting convention used prior to the Second Quarter 2001. During the Second and Third Quarters 2001, xylenes were reported as m,p-xylenes and o-xylenes, because the QAPP identified

reporting limits for these compounds only and not for total xylenes. The sum of the concentrations of m,p-xylenes and o-xylenes is equivalent to total xylenes. The reporting limit for total xylenes is 0.5 micrograms per liter (μg/L), the same as currently being used for the two xylene compounds.

5.4.3.3 PAH Analyses

The new method used for PAH compounds beginning in the Second Quarter 2001 (EPA Method 8310) has lower detection limits than the previous method (EPA Method 8270). EPA Method 8310 analytical data generally confirms historical findings that detectable concentrations of PAHs are not present at most sites.

5.4.3.4 Metals Analyses

The new method used to analyze 12 metals beginning in the Second Quarter 2001 (EPA Method 6020) has lower detection limits than the previous analytical method (EPA Method 6010). A description of the differences between these methods was included in previous reports (Treadwell & Rollo, 2002d, 2002f).

Results using EPA Method 6020 showed detectable concentrations of some metals for the first time in some wells, such as antimony and arsenic, beginning in the Second Quarter 2001. For metals such as antimony and arsenic, the detected concentrations were generally lower than the historical reporting limits. Analytical results measured between the Second Quarter 2001 and the Third Quarter 2002 indicated that some zinc concentrations and the majority of barium concentrations were higher than historically reported.

The reason for the increases in barium and zinc concentrations between the Second Quarter 2001 and the Third Quarter 2002 was determined to be a result of the brand of filter used, as discussed in the *Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2004* (Treadwell & Rollo, 2004d).

6.0 QUALITY ASSURANCE, QUALITY CONTROL, AND DATA VALIDATION

The QA/QC program for this project is designed to verify that the information presented in this report is based upon accurate and reliable laboratory analytical data. The program includes the collection and analyses of many types of QA/QC samples, including duplicates (Table 7), equipment rinsate blanks (Table 8), trip blanks (Table 9) source water blanks (Table 10), and running matrix spike/matrix spike duplicate (MS/MSDs) to ensure that the analytical laboratories perform and document all required calibrations and internal QA/QC procedures.

Overall, the project data quality objectives have been met for the First and Second Quarters 2006. Where data have required qualification, a discussion is provided in each quarterly data validation report and in each site-specific section. The following sections describe the data validation procedures and the results of the QA/QC sample evaluation for both the First and Second Quarters 2006.

6.1 Data Validation

DataVal reviewed both the electronic and paper data, and prepared Data Validation Summary Reports (DVSR) dated 20 June 2006 (DataVal, 2006a) and 18 August 2006 (DataVal, 2006b). The reports entitled, *Data Validation Summary Report for the First Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA* and *Data Validation Summary Report for the Second Quarter 2006, Groundwater Monitoring, Presidio of San Francisco, CA*, respectively, which are attached as Appendix D. The reports evaluate the relative percent difference (RPD) for the duplicate samples from Curtis & Tompkins and QC duplicates from CAS, and the following QC data (where applicable) for each analytical method.

- Reporting limits
- Holding times
- Target blanks
- Gas chromatograph/mass spectrometer equipment tunes
- Initial equipment calibration
- Continuing equipment calibration
- Matrix spike/matrix spike duplicate
- Laboratory control samples
- Surrogate recoveries
- Internal standards

The following data validation qualifiers used by DataVal and shown in our tables are those recommended in USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review (EPA, 1999).

U The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.

J The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample.

Jb The analyte was identified below the laboratory reporting limit but above the laboratory method detection limit and QAPP-specified reporting limit.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification."

NJ The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.

UJ The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.

R The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet QC criteria. The presence or absence of the analyte cannot be verified.

Table 11 summarizes the data qualifiers used during these events and previous Treadwell & Rollo sampling events.

6.2 Quality Assurance and Quality Control Sampling

Field QC samples include duplicates, QC duplicates, equipment rinsate blanks, field blanks, and trip blanks. The following sections summarize the QA/QC samples that were collected during the First and Second Quarters 2006.

6.2.1 Duplicate Samples

Duplicate groundwater samples were collected on a minimum schedule of 1 duplicate per 10 samples (10 percent) for the primary laboratory (Curtis & Tompkins), and 1 duplicate per 20 samples (5 percent) for the duplicate QC laboratories (CAS). Duplicate groundwater samples were collected using the same methods as the primary samples, as described in the FSP. The duplicate samples were analyzed for the same suite of analytes as the primary samples.

First Quarter 2006

For the First Quarter 2006, 171 primary samples were collected for analyses. 19 duplicate samples (11 percent) were analyzed by the primary laboratory and 12 QC duplicate samples (7 percent) were analyzed by the QC duplicate laboratory (CAS). The relative percentages of duplicate and QC duplicate samples collected are typically higher than the QAPP requirements in order to attain sufficient duplicates for each analysis. Table 7 summarizes the sample identifications and analyses for the duplicate samples. The analytical results for the duplicates are presented in the site-specific analytical tables in Appendix A.

Second Quarter 2006

For the Second Quarter 2006, 44 primary samples were collected for analyses. Six duplicate samples (14 percent) were analyzed by the primary laboratory and four QC duplicate samples (9 percent) were analyzed by the QC duplicate laboratory (CAS). The relative percentages of duplicate and QC duplicate samples collected are typically higher than the QAPP requirements in order to attain sufficient duplicates for each analysis. Table 7 summarizes the sample identifications and analyses for the duplicate samples. The analytical results for the duplicates are presented in the site-specific analytical tables in Appendix A.

6.2.1.1 Duplicate Sample Analytical Results

The field and primary laboratory duplicate precision was evaluated by collecting duplicate samples, as described in the FSP, submitting the samples blind to Curtis & Tompkins for analyses, and then calculating the RPD between the detected results in the sample and its duplicate. This evaluation assumes that the water sample collected from a well is homogenous.

The control limit of 50 percent or less was used for the RPDs to determine whether project data quality objectives were being met. RPDs are calculated for two samples by subtracting the concentration of Sample One from the concentration of Sample Two and then dividing this result by the average of the two concentrations.

First Quarter 2006

The overall correlation of analytical results met project data quality objectives. All analytes in each duplicate pair met the RPD control limit requirements, except for the following:

- In field duplicates 1349MW102 and DUP0307063C, the absolute difference between the results was greater than the 100 µg/L reporting limit for dissolved aluminum. The original result was non-detect at 100 µg/L and the duplicate result was 260 µg/L. In addition, the relative percent difference (RPD) between the detected results failed the 50% acceptance criteria for dissolved iron at 94%.

- In field duplicates 600GW108 and DUP0307061B the RPD between the detected results failed the 50% acceptance criteria for dissolved copper at 70%.
- In field duplicates 231GW21 and DUP0308061A, the absolute difference between the results was greater than the 300 µg/L reporting limit for TPHfo. The original result was non-detect at 300 µg/L and the duplicate result was 5,400 µg/L. The RPD between the detected results failed the 50% acceptance criteria for TPHfo at 119%.
- In field duplicates LF08GW04 and DUP0316064A, the absolute difference between the results was greater than the 0.01 mg/L reporting limit for cyanide. The original result was non-detect at 0.01 mg/L and the duplicate result was 0.03 mg/L. The RPD between the detected results failed the 50% acceptance criteria for cyanide at 67%.
- In field duplicates 1213GW101 and DUP0317062A the RPD between the detected results failed the 50% acceptance criteria for benzene at 61%.

The *Data Validation Summary Report for the Presidio Trust Groundwater Monitoring* (DVSR) First Quarter 2006 (Appendix D) discusses the duplicate sample RPD results, the analytical results and RPD calculations (Table 3). Data was not qualified by DataVal due to RPD failure of duplicate samples because the effect on the quality of the data is not known (DataVal, 2006a).

Second Quarter 2006

The detected results of the original sample and the associated duplicate sample were compared and the calculated RPDs reported. All analytes in each duplicate pair met the RPD control limit requirements, except for the following:

- In field duplicates 610GW103 and DUP0523061A, the relative percent difference (RPD) between the detected results failed the 50% acceptance criteria for alkalinity at 57%.
- In field duplicates 1213GW101 and DUP-05242006, the RPD between the detected results failed the 50% acceptance criteria for benzene (120%), TPH-gasoline (69%) and dissolved chromium (81%); and the absolute differences between the results were greater than the reporting limits for ethylbenzene and dissolved manganese. The original result for ethylbenzene was non-detect at 0.5 µg/L and the duplicate result was 2.7 µg/L. The original result for dissolved manganese was non-detect at 10 µg/L and the duplicate result was 29 µg/L.
- In field duplicates 1349MW100 and DUP0524063A, the absolute difference between the results was greater than the 0.2 µg/L reporting limit for alpha-chlordane. The original result was non-detect at 0.2 µg/L and the duplicate result was 0.8 µg/L

The DVSR Second Quarter 2006 (Appendix D) discusses the duplicate sample RPD results, the analytical results and RPD calculations (Table 3). Data was not qualified by DataVal due to

RPD failure of duplicate samples because the effect on the quality of the data is not known (DataVal, 2006b).

6.2.1.2 Quality Control Duplicate Sample Analytical Results

The laboratory-to-laboratory duplicate precision was evaluated by collecting QC duplicate samples and submitting the primary duplicate sample to Curtis & Tompkins and a QC duplicate sample to CAS. All the QC duplicate samples submitted the QC laboratory had the same sample identification as the primary sample, with a "CL" added to the end. The relative precision was evaluated by calculating the RPD between the detected results in the duplicate sample and its QC duplicate. This evaluation assumes that the water sample collected from a well is homogenous.

The control limit of 50 percent or less was used for the RPDs to determine whether project data quality objectives were being met.

First Quarter 2006

The overall correlation of analytical results between the two laboratories met project data quality objectives. All analytes in each duplicate pair met the RPD control limit requirements, except for:

- In QC split duplicates 1065PZ5AR and 1065PZ5ARCL, the RPD between the reported results failed the 50% RPD acceptance criteria for dissolved iron at 56%.
- In QC split duplicates LF4GW103 and LF4GW103CL, the absolute difference between the results was greater than the 100 µg/L reporting limit for dissolved iron. The original result was 510 µg/L and the duplicate result was non-detect at 100 µg/L.
- In QC split duplicates 1349MW102 and 1349MW102CL, the absolute difference between the results was greater than the 1 µg/L reporting limit for dissolved copper. The original result was non-detect at 1 µg/L and the duplicate result was 2.7 µg/L.
- In QC split duplicates 231GW21 and 231GW21CL, the RPD between the reported results failed the 50% RPD acceptance criteria for TPH-diesel at 114%. The absolute difference between the results was greater than the 1 µg/L reporting limit for chloroform. The original result was non-detect at 1 µg/L and the duplicate result was 2.7 µg/L.
- In QC split duplicates 1260GW102 and 1260GW102CL, the absolute difference between the results was greater than the 50 µg/L reporting limit for TPH-diesel. The original result was non-detect at 50 µg/L and the duplicate result was 120 µg/L.
- In QC split duplicates 950GW108 and 950GW108CL, the absolute difference between the results was greater than the 50 µg/L reporting limit for TPH-diesel. The original result was non-detect at 50 µg/L and the duplicate result was 120 µg/L.

The DVSR First Quarter 2006 (Appendix D) discusses the QC split sample RPD results, the analytical results and RPD calculations (Table 4). Data was not qualified by DataVal due to RPD failure of QC split samples because the effect on the quality of the data is not known (DataVal, 2006a).

Second Quarter 2006

The overall correlation of analytical results between the two laboratories met project data quality objectives. All analytes in each duplicate pair met the RPD control limit requirements, except for the following:

- In QC split duplicates 1213GW101 and 1213GW101CL, the absolute difference between the results was greater than the 1 µg/L reporting limit for dissolved copper. The original result was non-detect at 1 µg/Land the duplicate result was 3 µg/L.
- In QC split duplicates 1349MW100 and 1349MW100CL, the relative percent difference (RPD) between the reported results failed the 50% RPD acceptance criteria for TPH-gasoline (65%), fluorene (61%), fluoranthene (123%) and benzo(a)anthracene (-125%); and the absolute differences between the results were greater than the reporting limits for heptachlor epoxide, 4,4'-DDT and dissolved copper. The original result for heptachlor epoxide was 0.4 µg/L and the duplicate result was non-detect at 0.05 µg/L. The original result for 4,4'-DDT was 0.8 µg/L and the duplicate result was non-detect at 0.1 µg/L. The original result for dissolved copper was non-detect at 1 µg/L and the duplicate result was 4.3 µg/L. The DVSR Second Quarter 2006 (Appendix D) discusses the QC split sample RPD results, the analytical results and RPD calculations (Table 4). Data was not qualified by DataVal due to RPD failure of QC split samples because the effect on the quality of the data is not known (DataVal, 2006b)
- In QC split duplicates 1065MW9A and 1065MW9A CL, the absolute difference between the results was greater than the 0.04 mg/L reporting limit for sulfide. The original result was non-detect at 0.04 mg/L and the duplicate result was 0.17 mg/L.
- In QC split duplicates BHWGW01 and BHWGW01CL, the absolute difference between the results was greater than the 1 µg/L reporting limit for dissolved copper. The original result was non-detect at 1 µg/L and the duplicate result was 2.3 µg/L.

6.2.2 Equipment Rinsate Blanks

Up to one equipment rinsate blank (ERB) was collected per non-dedicated sampling device per day. Per the FSP, the ERBs were collected by pouring clean laboratory-supplied deionized water over the decontaminated sampling device and directly into the sampling container. Table 8 summarizes the analytical results for the ERB samples.

First Quarter 2006

During this sampling event, one ERB was collected and submitted for the same analyses as the sample that the equipment was used to collect. The following analytes were detected in the ERB during the First Quarter 2006.

- Equipment blank LF08GW02BRB03 had a detected level of sodium at 1,300 µg/L. The associated samples had sodium values greater than five times the blank amount, and qualification was not required.
- Equipment blank LF08GW06RB01 had a detected level of sodium at 980 µg/L. The associated samples had sodium values greater than five times the blank amount, and qualification was not required.
- Equipment blank HWGW101RB04 had a detected level of alkalinity at 3.2 mg/L. The associated samples had alkalinity values greater than five times the blank amount and qualification was not required.
- Equipment blank LF08GW06RB01 had detected levels of alkalinity (2.8 mg/L) and total dissolved solids (220 mg/L). The associated samples had alkalinity values greater than five times the blank amount. Qualification was not required for these physical property parameters.

Second Quarter 2006

During this sampling event, one ERB was collected and submitted for the same analyses as the sample that the equipment was used to collect. No analytes were detected in the ERB during the Second Quarter 2006.

6.2.3 Trip Blanks

The laboratory supplied 40-milliliter trip blanks with each shipment of volatile organic compound (VOC) sampling containers sent from the laboratory. One trip blank was included with each cooler containing field samples planned for VOC analyses. Table 9 summarizes the analytical results for the trip blank samples.

First Quarter 2006

11 trip blank samples were received by the analytical laboratories and analyzed for VOCs. No VOCs were detected within any of the trip blank samples collected during this quarter.

Second Quarter 2006

Three trip blank samples were received by the analytical laboratories and analyzed for VOCs. No VOCs were detected within any of the trip blank samples collected during this quarter.

6.2.4 Source Water Blanks

Blaine Tech Services, Inc., the contractor who performed groundwater monitoring tasks, provided deionized water for decontamination purposes from the water deionization system at its San Jose facility. Source water blanks were collected from the outflow of the water deionization system and from the water tanks mounted on one of the sampling vehicles. The source water blanks were submitted to the primary laboratory for all analyses in the Groundwater Monitoring Program. Table 10 summarizes the analytical results for the source water blanks.

First Quarter 2006

Source blank DW031606A was collected from the water tank on a sampling vehicle and had a detected concentrations of total alkalinity (250 mg/L), bicarbonate (250 mg/L), TDS (60 mg/L), bromodichloromethane (0.7 µg/L), and chloroform (7 µg/L). No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

- Total alkalinity was reported in project samples at concentrations ranging from 29 mg/L to 1,300 mg/L. Total alkalinity concentrations in samples collected at the Presidio during the First Quarter 2006 appear to be comparable to those collected in previous quarters, therefore, the detected concentration in the source water blank does not appear to be significant.

- Bicarbonate was reported in project samples at concentrations ranging from 29 mg/L to 1,300 mg/L. Bicarbonate concentrations in samples collected at the Presidio during the First Quarter 2006 appear to be comparable to those collected in previous quarters, therefore, the detected concentration in the source water blank does not appear to be significant.

- TDS was reported in project samples at concentrations ranging from 130 mg/L to 2,890 mg/L. The vast majority of samples collected at the Presidio during the First Quarter 2006 had concentrations greater than 5 times the concentration detected within the source blank and therefore, the detected concentration in the source water blank does not appear to be significant.

- Bromodichloromethane was not detected in any other project samples during the First Quarter 2006 and therefore, this source water detection does not appear to be significant.

- Chloroform was reported in project samples at concentrations ranging from non-detect at < 0.5 µg/L to 2.7 µg/L. Chloroform was detected in concentrations greater than the reporting limit in samples 231GW17, 231GW18, 231GW21, 231GW27, and BHWGW01. These detections could be a result of source water contamination due to the relatively higher concentration of chloroform found in the source water.

Source blank DW031306B was collected from the water deionization system and had a detected level of TDS (70 mg/L) and chloroform (3.1 µg/L). The majority of samples collected at the Presidio during the First Quarter 2006 had TDS concentrations significantly greater than the concentration detected within the source blank and therefore, the detected concentration in the source water blank does not appear to be significant. The chloroform identified in the source water could have potentially resulted in chloroform detections in samples 231GW17, 231GW18, 231GW21, 231GW27, and BHWGW01. No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

Second Quarter 2006

Source blank DW052506A was collected from the water tank on a sampling vehicle and had detected concentrations of total alkalinity (8.9 mg/L), chloride (0.26 mg/L), sulfate (4.9 mg/L), TDS (5,600 mg/L), calcium (3,600 µg/L), and magnesium (910 µg/L). No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

- Total alkalinity was reported in project samples at concentrations ranging from 180 mg/L to 1,200 mg/L. All of samples collected at the Presidio during the Second Quarter 2006 had concentrations greater than 5 times the concentration detected within the source blank and therefore, the detected concentration in the source water blank does not appear to be significant.

- Chloride was reported in project samples at concentrations ranging from 18 mg/L to 930 mg/L. All of samples collected at the Presidio during the Second Quarter 2006 had concentrations greater than 5 times the concentration detected within the source blank and therefore, the detected concentration in the source water blank does not appear to be significant.

- Sulfate was reported in project samples at concentrations ranging from non-detect at <0.5 mg/L to 390 mg/L. Sulfate concentration in the source water sample is considerably less than the vast majority of the samples collected at the Presidio during the Second Quarter 2006. Sulfate concentrations in samples collected at the Presidio during the Second Quarter 2006 appear to be comparable to those collected in previous quarters, therefore, the detected concentration in the source water blank does not appear to be significant.

- TDS was reported in project samples at concentrations ranging from 280 mg/L to 2640 mg/L. Concentration of TDS was greater than that of any of the samples collected at the Presidio during the Second Quarter 2006. The new maximum concentrations of TDS could potentially be a result of source water contamination.

- Calcium was reported in project samples at concentrations ranging from non-detect at <500 µg/L to 165,000 µg/L. Calcium concentration in the source water sample is considerably less than the vast majority of the samples collected at the Presidio during the Second Quarter 2006, therefore, the detected concentration in the source water blank does not appear to be significant.

- Magnesium was reported in project samples at concentrations ranging from 1,400 µg/L to 390,000 µg/L. Magnesium concentration in the source water sample is considerably less than the vast majority of the samples collected at the Presidio during the Second Quarter 2006, therefore, the detected concentration in the source water blank does not appear to be significant.

Source blank DW053006B was collected from the water deionization system and had detected concentrations of total alkalinity (4 mg/L), sulfate (1.4 mg/L) TDS (60 mg/L), calcium (2,000 µg/L). Concentration in the source water sample for these four analytes are considerably less than the vast majority of the samples collected at the Presidio during the Second Quarter 2006, therefore, the detected concentrations in the source water blank does not appear to be significant. No other analytes were detected above laboratory detection limits within this source water sample during this quarter.

6.2.5 Temperature Blanks

Temperature blanks were included in coolers containing field samples sent to analytical laboratories, and the blank temperatures were recorded by the laboratory upon arrival. The QAPP specifies a temperature of 4.0 ^{O}C, plus or minus 2.0 ^{O}C.

First Quarter 2006

The temperature of all 18 temperature blanks sent to Curtis & Tompkins ranged from 2.0 to 5.2 ^{O}C, which is within QAPP requirements.

Second Quarter 2006

The temperature range of all 12 temperature blanks ranged from 2.1 to 5.8 ^{O}C except for two coolers sent to Curtis & Tompkins, which had temperatures of 0.5 and 12.8 ^{O}C upon arrival. The slightly lower blank temperature is not considered to be significant. The cooler with the 12.8 ^{O}C temperature blank did contain ice upon arrival at Curtis & Tompkins and the temperature blank

was noted to be on top of the ice, which indicates that its temperature was likely higher than those of the samples. A review of the results from samples that were shipped to Curtis & Tompkins in this cooler revealed no evidence of sample quality degradation. The slightly higher blank temperature is not considered to be significant.

6.2.6 Matrix Spike and Matrix Spike Duplicate Samples

Three times the normal amount of sample volume was collected on every twentieth groundwater sample for MS/MSD analysis. The MS/MSD results for the various analytical methods were evaluated by DataVal and discussed in the DVSRs, which are attached as Appendix D.

7.0 FIELD WORK DOCUMENTATION

This section describes the field documentation prepared for this sampling event, in conformance with the FSP. Field personnel are responsible for recording field activities on the appropriate field documentation form in sufficient detail to allow reconstruction of the sampling event without relying on memory. The location of completed field documentation forms and logs described in the FSP and used during this sampling event are described below.

- Field Instrument Calibration Logs (located in Appendix B and project files)
- Health & Safety Meeting Form (located in project files)
- Groundwater Level Measurements Logs (located in Appendix C and project files)
- Monitoring Well Sampling Logs (located at the end of each site-specific section in Appendix A and in project files)
- Chain-of-Custody Forms (located in Appendices E and F and project files)
- Field Investigation Daily Reports (located in project files)
- Bound Field Book (located in project files)
- Field Audit Forms (located in project files)

8.0 DISPOSAL OF PURGE AND DECONTAMINATION WATER

All water purged from wells and used for decontamination during the First and Second Quarters 2006 was collected and stored in two 2,800-gallon polyethylene above ground storage tanks located at the Central Magazine. On 29 March and 25 May 2006, water samples WT032906 and WT052506, respectively, were collected from the water tanks with laboratory-supplied containers and submitted to the primary laboratory for the analytes required by the City of San Francisco for batch discharge into the sanitary sewer system. Table 12 summarizes the analyses required by the City of San Francisco and the analytical results. The laboratory data reports are in Appendix E. All results were below discharge criteria. Trust personnel discharged the water to the sanitary sewer.

In accordance with the Fill Site 5 RAP, several analyses have been reduced to semi-annual (Q1, Q3) because no cleanup level exceedances have been measured within four consecutive monitoring events. Chlorinated herbicide analyses have been proposed for removal from the Building 1349 Area due to a lack of significant detections. Additionally, in accordance with the Fill Site 5 RAP, chlorinated herbicide analyses will no longer be conducted at Building 1349 Area monitoring wells associated with Fill Site 5. ORP is proposed to be measured for the evaluation of redox conditions, in accordance with recommendations from the Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites (pending).

Fill Site 5	LF5GW100	Q	Low Flow	Hand	2		Q1, Q3						Q1, Q3 (23)			Q1, Q3	Q1, Q3	**Q1, Q3**	Q1, Q3	~~Q1, Q3~~	Q1, Q3		Q1, Q3				~~Q1, Q3~~	Q1, Q3	Q1, Q3	Q1, Q3		The following sampling locations are included in the Fill Site 5 groundwater monitoring plan; LF5GW100 through LF5GW104, LF5SP100, 1349MW02, 1349MW03R, 1349MW101, and 1349MW102. Several analyses were reduced to semi-annual monitoring (Q1, Q3) because no cleanup level exceedances have been detected in four consecutive quarters, in accordance with the RAP. The only analytes that have been detected in excess of cleanup levels (within the last four quarters) are dissolved metals within LF5GW101 and LF5SP100. Metals analyses will continue on a quarterly basis within LF5GW101 and LF5SP100. Additionally, it should be noted that a metals exceedance was recently reported within 1349MW03R. Chlorinated herbicides and PCBs are proposed for removal from the Fill Site 5 monitoring program due to a lack of detections, in accordance with the RAP. The reduction to semi-annual sampling for VOCs and PAHs within Fill Site 5 monitoring wells (LF5GW100 through LF5GW104) (per the Fill Site 5 RAP) was approved in the Fourth Quarter 2004 because no RAP-specified cleanup levels have been exceeded in at least four quarters for any of these compounds within any Fill Site 5 monitoring well samples.

Baker Beach Disturbed Area 3	BB3GW100	Q	Modified	Hand	1		Q						Q (22)			Q	Q											Q	Q	Q		Groundwater analyses ~~will be~~ are conducted in general accordance with the Baker Beach Disturbed Area 3 ~~Remedial Action Plan~~ (RAP). Fixed monitoring points BB3SW100 through BB3SW102 ~~will be~~ are sampled using a disposable bailer and ~~will be~~ are purged prior to sampling, in accordance with the modified method of purging.
Baker Beach Disturbed Area 3	BB3GW101	Q	Modified	Hand	1		Q						Q (22)			Q	Q											Q	Q	Q		
Baker Beach Disturbed Area 3	BB3PZ101	Q	Modified	Hand	1		Q						Q (22)			Q	Q											Q	Q	Q		In accordance with the RAP, TPH analyses are proposed for reduction to semi-annual sampling at BB3SW101 and BB3SW102, as no TPH detections have occurred for four quarterly events. For metals, chromium exceeded the cleanup level during the Fourth Quarter 2005 at BB3SW102; thus, all seeps will continue to be analyzed on a quarterly basis for metals and general chemistry parameters. At BB3GW101, BB3PZ101, and BB3SW100, no detections have occurred above cleanup levels over one or two events; sampling of these wells will continue on a quarterly basis until sufficient data have been collected. At BB3GW100, no TPH detections have occurred and metals have not been detected above cleanup levels. Per the RAP, monitoring at BB3GW100 could be reduced to a semi-annual basis, however, quarterly sampling of this well will continue for evaluation of upgradient conditions.

Notes
1 - Normal, Low Flow, Modified, and Surface water sampling techniques. A description of sampling techniques can be found in the *Field Sampling Plan, Presidio Groundwater Monitoring Project* (Treadwell & Rollo, 2001a).
2 - Truck - Well accessible by truck
LIV - Low Impact Vehicle - Well accessible by LIV or hand truck only
Hand - Well accessible by hand truck only
3 - Sampling Order: At each site sample the wells with the lowest number first. For example, sample the number 1 wells first, the number 2 wells second etc. The following key explains the numbering system.
1 - Wells without significant detections of chemicals of concern
2 - Wells with occasional detections of low concentrations chemicals of concern
3 - Wells with consistent or recent detections of low concentrations chemicals of concern
4 - Wells with high concentrations of chemicals of concern
5 - Wells with very high concentrations of chemicals of concern. Potential for free phase product.
4 - Dissolved gases include methane, ethane, and ethene.
5 - Beginning with Second Quarter 2003, variance was granted from QAPP specified reporting limit requirements for seven metals.
6 - The table has been reformatted to one dissolved metals column. The number of dissolved metals proposed for analysis are denoted by parentheses. For example, Q (23) indicates the 23 metals list should be analyzed on a quarterly basis. The metals associated with each metals list are detailed below.
23 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Ag, Na, Se, Tl, V, and Zn.
22 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Ni, K, Ag, Na, Se, Tl, V, and Zn.
15 Metals List - Al, Sb, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
14 Metals List - Al, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
9 Metals List - As, Cr, Cd, Cu, Fe, Mn, Pb, Ni and Zn.
8 Metals List - As, Cr, Cd, Cu, Fe, Pb, Ni and Zn.
7 Metals List - As, Cr, Cd, Cu, Pb, Ni and Zn.
3 Metals List - Al, Fe, and Cr.
7 - Dissolved Oxygen (DO) concentration will be included in field sampling logs. DO values should be recorded immediately before sample collection.

8 - Oxidation-Reduction Potential (ORP) is measured within all wells proposed to be sampled using the low flow method using a flow through cell. For specified wells identified to be sampled by either the normal or modified methods and proposed for ORP measurements, ORP will be measured using a down-hole meter.
9 - Total sulfides are analyzed by the laboratory for all samples collected at the Presidio.
10 - Stoddard Solvent is a specialized formulation of gasoline. Laboratory quantification for Stoddard Solvent is achieved by comparing the shape of the analytical chromatogram within the same carbon range as TPHg for a diagnostic combination of spikes. Since TPHg is also proposed for analysis in this well, the comparison between this well and other sites which may be or have been evaluated for Stoddard Solvent will be maintained. Stoddard Solvent has been specified for this well per MACTEC request. MACTEC will evaluate the Stoddard Solvent data as part of their Building 1047 investigation.

Bold red text indicates proposed changes for the First Quarter 2006.
All surface seeps where metals analysis is proposed will have two samples collected; one will be filtered and analyzed for dissolved metals and another one will not be filtered and analyzed for total metals.
EM - Elevation Monitoring only
Surface - Surface Water Sampling per Standard Operating Procedure
Trust - the Presidio Trust will evaluate seep BB3SP01 for flow on a quarterly basis and will inform the sampling crew if a sample can be collected.
Q1, Q3, etc. - Sample during specified quarters only
Q - Sample during all quarters unless otherwise directed
***Q1 - Sample during Q1 2006 only**
TPHg, TPHd, TPHfo, TPHss: Total Petroleum Hydrocarbons as gasoline, diesel, fuel oil, and stoddard solvent - EPA 3630A: Silica Gel Cleanup Step
General Chemistry Parameters; Alkalinity (total), bicarbonate, carbonate, chloride, fluoride, nitrate+nitrite (as N), sulfate
NDMA - N-nitrosodimethylamine
TBD - To Be Determined

Building 1349	1349MW01	Q	Modified	Truck	1		Q1						Q1 (23)			Q1	Q1	Q1	Q1		Q1		Q1					Q1	Q1	Q1		The reduction to annual sampling at wells (1349MW01, and 1349MW103 through 1349MW105) not serving as upgradient monitoring points for Fill Site 5 (per the Fill Site 5 RAP) until the Building 1349 Area CAP has been finalized was approved by the stakeholders prior to First Quarter 2004 based on the lack of significant detections. ~~In accordance with the Fill Site 5 RAP, several analyses have been reduced to semi-annual (Q1, Q3) because no cleanup level exceedances have been measured within four consecutive monitoring events.~~ ~~Chlorinated herbicide analyses have been proposed for removal from the Building 1349 Area due to a lack of significant detections. Additionally, in accordance with the Fill Site 5 RAP, chlorinated herbicide analyses will no longer be conducted at Building 1349 Area monitoring wells associated with Fill Site 5.~~ ORP is ~~proposed to be~~ measured for the evaluation of redox conditions, in accordance with recommendations from the Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites (pending). TPH, PAHs, VOCs, PCBs, chlorinated herbicides, general chemistry parameters, TDS, and dissolved metals (See Attachment 1 for a discussion of chromium results) have met their post-remediation groundwater monitoring requirements and cleanup levels from the Fill Site 5 RAP for the required frequency of monitoring within 1349MW03R, 1349MW101, and 1349MW102. The Trust requests cessation of these analytical compounds from the Groundwater Monitoring Program at Fill Site 5 / Building 1349 (including 1349MW03R, 1349MW101, and 1349MW102) prior to the Second Quarter 2006 (see Attachment 1). It is noted that these three wells will be monitored per requirements of the Building 1349 Area CAP, once it is finalized and implemented.

Baker Beach Disturbed Area 3	BB3GW100	Q	Modified	Hand	1		Q						Q (22)			Q	Q											Q	Q	Q		Groundwater analyses are conducted in general accordance with the Baker Beach Disturbed Area 3 RAP. Fixed monitoring points BB3SW100 through BB3SW102 are sampled using a disposable bailer and are purged prior to sampling, in accordance with the modified method of purging.
Baker Beach Disturbed Area 3	BB3GW101	Q	Modified	Hand	1		Q						Q (22)			Q	Q											Q	Q	Q		
Baker Beach Disturbed Area 3	BB3PZ101	Q	Modified	Hand	1		Q						Q (22)			Q	Q											Q	Q	Q		In accordance with the RAP, TPH analyses ~~are proposed for reduction~~ were reduced to semi-annual sampling at BB3SW101 and BB3SW102, as no TPH detections have occurred for four quarterly events. For metals, chromium exceeded the cleanup level during the Fourth Quarter 2005 at BB3SW102; thus, all seeps will continue to be analyzed on a quarterly basis for metals and general chemistry parameters. At BB3GW101, BB3PZ101, and BB3SW100, no detections have occurred above cleanup levels over one or two events; sampling of these wells will continue on a quarterly basis until sufficient data have been collected. At BB3GW100, no TPH detections have occurred and metals have not been detected above cleanup levels. Per the RAP, monitoring at BB3GW100 could be reduced to a semi-annual basis, however, quarterly sampling of this well will continue for evaluation of upgradient conditions.

Mini-CAP Areas	FM14EX07GW102	Q	Normal	Truck	1												Q					Q	~~*Q1~~					Q	Q	Q		
Mini-CAP Areas	FM14EX07GW101	Q	Normal	Truck	1												Q					Q	~~*Q1~~					Q	Q	Q		VOCs were detected within 1213GW101 during the First Quarter 2006, therefore, VOC analyses will continue on a quarterly basis within this well. Additionally, since BTEX/MTBE is included in the VOC list, this analyses has been removed. The PAH, fluoranthene, was detected within FM14EX07GW102 and 514AGW101 during the First Quarter 2006 and therefore, PAH analyses are scheduled to be conducted quarterly within wells with detections (FM14EX07GW101, FM14EX07GW102, 1213GW101, and 514AGW101). TPH compounds will continue to be analyzed within wells with detections (FM14EX07GW101, FM14EX07GW102, 1213GW101, and 514AGW101) to establish a baseline of data.
Mini-CAP Areas	1260GW102	Q	Normal	Truck	1												~~Q~~					~~Q~~	~~*Q1~~					~~Q~~	~~Q~~	~~Q~~		
Mini-CAP Areas	1260GW103	Q	Normal	Truck	1												~~Q~~					~~Q~~	~~*Q1~~					~~Q~~	~~Q~~	~~Q~~

Mini-CAP Areas	1221GW104	Q	Normal	Truck	1		Q						Q (22)				~~Q~~					~~Q~~	~~*Q1~~					~~Q~~	~~Q~~	~~Q~~		Quarterly analysis of dissolved metals and general chemistry parameters are proposed for wells 1213GW101 and 1221GW104 to evaluate conditions upgradient of Battery Howe/Wagner. ~~One round of confirmation sampling for PAHs is proposed at all mini-CAP wells to confirm previous sampling where PAH laboratory reporting limits were greater than cleanup levels. One round of confirmation sampling for VOCs is proposed at 1213GW101 to confirm the presence of VOCs. Groundwater sampling is no longer proposed within wells 1260GW101 through 1260GW103 and 1221GW101 through 1221GW104 because no analytes were detected above applicable cleanup levels, in accordance with the Mini-CAPs Work Plan.~~

Landfill 10	LF10GW01	Q	Modified	Hand	1		Q1						Q1 (23)			Q1	Q1					Q1						Q	Q	Q		A Focused Feasibility Study (FFS) for Landfills 8 and 10 has been prepared. The Trust is preparing a RAP for the two landfill sites, which is anticipated to be distributed to stakeholders in 2007~~.~~. LF10GW02 and LF10SP01 could not be sampled during Q1 2006 due to thick vegetation. Samples will be collected at these locations during Q2 2006 if the brush can be cleared. TPH analyses have been increased from an annual to quarterly basis in all Landfill 10 wells and seep due to recent detections in groundwater at Landfill 10. The TPH data will be evaluated in the RAP. ~~The sampling will continue as shown until the RAP is implemented.~~

Notes
1 - Normal, Low Flow, Modified, and Surface water sampling techniques. A description of sampling techniques can be found in the *Field Sampling Plan, Presidio Groundwater Monitoring Project* (Treadwell & Rollo, 2001a).
2 - Truck - Well accessible by truck
LIV - Low Impact Vehicle - Well accessible by LIV or hand truck only
Hand - Well accessible by hand truck only
3 - Sampling Order: At each site sample the wells with the lowest number first. For example, sample the number 1 wells first, the number 2 wells second etc. The following key explains the numbering system.
1 - Wells without significant detections of chemicals of concern
2 - Wells with occasional detections of low concentrations chemicals of concern
3 - Wells with consistent or recent detections of low concentrations chemicals of concern
4 - Wells with high concentrations of chemicals of concern
5 - Wells with very high concentrations of chemicals of concern. Potential for free phase product.
4 - Dissolved gases include methane, ethane, and ethene.
5 - Beginning with Second Quarter 2003, variance was granted from QAPP specified reporting limit requirements for seven metals.
6 - The table has been reformatted to one dissolved metals column. The number of dissolved metals proposed for analysis are denoted by parentheses. For example, Q (23) indicates the 23 metals list should be analyzed on a quarterly basis. The metals associated with each metals list are detailed below.
23 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Ag, Na, Se, Tl, V, and Zn.
22 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Ni, K, Ag, Na, Se, Tl, V, and Zn.
15 Metals List - Al, Sb, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
14 Metals List - Al, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
9 Metals List - As, Cr, Cd, Cu, Fe, Mn, Pb, Ni and Zn.
8 Metals List - As, Cr, Cd, Cu, Fe, Pb, Ni and Zn.
7 Metals List - As, Cr, Cd, Cu, Pb, Ni and Zn.
3 Metals List - Al, Fe, and Cr.
7 - Dissolved Oxygen (DO) concentration will be included in field sampling logs. DO values should be recorded immediately before sample collection.
8 - Oxidation-Reduction Potential (ORP) is measured within all wells proposed to be sampled using the low flow method using a flow through cell. For specified wells identified to be sampled by either the normal or modified methods and proposed for ORP measurements, ORP will be measured using a down-hole meter.
9 - Total sulfides are analyzed by the laboratory for all samples collected at the Presidio.
10 - Stoddard Solvent is a specialized formulation of gasoline. Laboratory quantification for Stoddard Solvent is achieved by comparing the shape of the analytical chromatogram within the same carbon range as TPHg for a diagnostic combination of spikes. Since TPHg is also proposed for analysis in this well, the comparison between this well and other sites which may be or have been evaluated for Stoddard Solvent will be maintained. Stoddard Solvent has been specified for this well per MACTEC request. MACTEC will evaluate the Stoddard Solvent data as part of their Building 1047 investigation.

Bold red text indicates proposed changes for the Second Quarter 2006.
All surface seeps where metals analysis is proposed will have two samples collected; one will be filtered and analyzed for dissolved metals and another one will not be filtered and analyzed for total metals.
EM - Elevation Monitoring only
Surface - Surface Water Sampling per Standard Operating Procedure
Trust - the Presidio Trust will evaluate seep BB3SP01 for flow on a quarterly basis and will inform the sampling crew if a sample can be collected.
Q1, Q3, etc. - Sample during specified quarters only
Q - Sample during all quarters unless otherwise directed
~~*Q1 - Sample during Q1 2006 only~~
Q2* - Annual sampling has been moved to the Second Quarter because samples could not be collected during Q1 2006. Samples will be collected during Q2 2006, if possible.
TPHg, TPHd, TPHfo, TPHss: Total Petroleum Hydrocarbons as gasoline, diesel, fuel oil, and stoddard solvent - EPA 3630A: Silica Gel Cleanup Step
General Chemistry Parameters; Alkalinity (total), bicarbonate, carbonate, chloride, fluoride, nitrate+nitrite (as N), sulfate
NDMA - N-nitrosodimethylamine
TBD - To Be Determined

Mini-CAP Areas	514AGW101	16:47	20.23	201.34	181.11	MW	Q

Notes:
1 - Depth to water reading was measured from the northernmost side of the casing.
The elevation presented is the average of three measurements.
2 - Elevations reported in Presidio Lower Low Water (PLLW) datum.
3 - Surface water sample, no groundwater elevation.
4 - UBR01GW01 was unable to be located due to gravel covering.
5 - Value represents the bottom of casing elevation in PLLW.
6 - Groundwater level was above the top of casing.
7 - Piezometers 1065PZ6A and 1065PZ6B were covered in bark and dirt and could not be accessed on 6 March 2006.
8 - The lid of monitoring well LF10GW100 has been surveyed by the Trust (175.60 feet PLLW). The elevation difference between the monitoring well lid and the top of casing was measured in the field and has been verified to be 0.30 feet. Therefore, the LF10GW100 top of casing elevation is approximately 175.30 feet PLLW.
9 - BB3PZ101 was formerly named BB3SW103. Additionally, the depth to water measurement (14.45 feet) during the Fourth Quarter 2004 was measured from the ground surface. Subsequently, the ground and the top of casing elevations were surveyed and the depth to water measurement was converted to a top of casing measurement (16.80 feet).
10 - Predicted tidal schedules were taken from:
http://tidesandcurrents.noaa.gov/station_retrieve.shtml?type=Tide+Data
11 - Actual high and low tidal schedules were taken from:
http://tidesandcurrents.noaa.gov/data_menu.shtml?stn=9414290%20San%20Francisco,%20CA&type=Tide%20Data
Water level magnitudes were then converted into the PLLW datum.

Predicted Tidal Schedule on 6 March 2006 [10]:
Low Tide - 11:12 AM
High Tide - 6:48 PM

Observed Tidal Schedule and Magnitude on 6 March 2006 [11]:
Low Tide - 11:08 AM (Magnitude 0.8 feet PLLW)
High Tide - 7:06 PM (Magnitude 6.41 feet PLLW)

Acronyms
FMP - Fixed Water Monitoring Point consisting of a slotted PVC casing installed up to 3 feet below ground surface.
MW - Monitoring well
NA - Not applicable
NM - Not measured
PZ - Piezometer
Q - Quarterly monitoring schedule

Mini-CAP Areas	514AGW101	14:28	20.09	201.34	181.25	MW	Q

Table 2B
Groundwater Elevation Summary for Presidio Monitoring Wells
Elevations Collected on 22 May 2006
Presidio of San Francisco, California

Site	Well ID	Time	Average Depth to Water [1] (feet)	Top of Casing Elevation [2] (feet PLLW)	Groundwater Elevation [2] (feet PLLW)	Well Type	Water Level Frequency

Notes:
1 - Depth to water reading was measured from the northernmost side of the casing.
The elevation presented is the average of three measurements.
2 - Elevations reported in Presidio Lower Low Water (PLLW) datum.
3 - Surface water sample, no groundwater elevation.
4 - UBR01GW01 was unable to be located due to gravel covering.
5 - Value represents the bottom of casing elevation in PLLW.
6 - Groundwater level was above the top of casing.
7 - Unable to locate monitoring well / piezometer on 22 May 2006.
8 - The lid of monitoring well LF10GW100 has been surveyed by the Trust (175.60 feet PLLW). The elevation difference between the monitoring well lid and the top of casing was measured in the field and has been verified to be 0.30 feet. Therefore, the LF10GW100 top of casing elevation is approximately 175.30 feet PLLW.
9 - Piezometer used to monitor surface water seep location.
10 - BB3PZ101 was formerly named BB3SW103. Additionally, the depth to water measurement (14.45 feet) during the Fourth Quarter 2004 was measured from the ground surface. Subsequently, the ground and the top of casing elevations were surveyed and the depth to water measurement was converted to a top of casing measurement (16.80 feet).
11 - Predicted tidal schedules were taken from:
http://co-ops.nos.noaa.gov/cgi-bin/get_pred.cgi?year=2005&stn=1813+San+Francisco
12 - Actual high and low tidal schedules and magnitudes were taken from:
http://co-ops.nos.noaa.gov/data_res.html by selecting 'U.S. and Global Coastal Stations' then selecting station number '9414290 San Francisco, CA'. Water level magnitudes were taken by selecting the 'W3 - High/Lows' Time Interval and converting the data into the PLLW datum.

Predicted Tidal Schedule on 22 May 2006 [10]:
Low Tide - 8:12 PM
High Tide - 11:42 AM

Observed Tidal Schedule and Magnitude on 22 May 2006 [11]:
Low Tide - 8:06 PM (Magnitude 0.79 feet PLLW)
High Tide - 11:36 AM (Magnitude 5.6 feet PLLW)

Acronyms
FMP - Fixed Water Monitoring Point consisting of a slotted PVC casing installed up to 3 feet below ground surface.
MW - Monitoring well
NA - Not applicable
NM - Not measured
PZ - Piezometer
Q - Quarterly monitoring schedule

Footnotes
1 - BB3PZ101 was formerly named BB3SW103
2 - Note BBDA 3 fixed monitoring points
3 - Piezometer construction details for 1065PZ5AR are based on narrative description, last paragraph of Section 4.6, *Interim Data Report, Building 1065 Area, Presidio of San Francisco, California , February 19, 2003,* by MACTEC.
4 - Well construction details for OW-1 are from a .pdf boring log (10-14-2003 E:\Backups\OW-1.bor) provided by the Trust via email on 14 October 2003.
5 - OW-1 total depth was reported as 29.12 feet in a .pdf boring log (10-14-2003 E:\Backups\OW-1.bor) provided by the Trust via email on 14 October 2003. Based on screen interval, this value was assumed to be in error and was increased to 30.12.
6 - All well construction details for the Doyle Drive wells were measured from boring logs and converted from metric units as reported in Attachment A to the *Request for Authorization to Perform a Aquifer Testing near Building 230 at the Presidio, San Francisco,* by Baseline Environmental Consulting, 1 April 2002. Boring logs do not indicate sand trap or presence of end caps. Therefore, the bottom of casing is the same as the bottom of the screened interval.
7 - Borehole diameter was not reported for Doyle Drive wells on boring logs included as Attachment B to the *Request for Authorization to Perform a Aquifer Testing near Building 230 at the Presidio, San Francisco* , by Baseline Environmental Consulting, 1 April 2002. Boring method described as "rotary wash" without reference to boring diameter in the *Data Report, Piezometer Installation and Development, Doyle Drive Reconstruction Project, San Francisco,* by Baseline Environmental Consulting, 11 April 2001.

NR - Not reported
PLLW - Presidio Lower Low Water datum
TBD - To be determined

Note
See Groundwater Sampling Standard Operating Procedure No. 002 in the *Field Sampling Plan, Presidio Groundwater Monitoring Project* (Treadwell & Rollo, 2001a) for complete equations for calculating borehole volumes.

Table 5
Analytical Plan Summary
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

Analyte	Laboratory Method	Container Type and Volume [1]	Preservative [2]	Holding Time [1]
TPH as gasoline (carbon range C7-C12)	Modified EPA 8015B	3 x 40 mL VOAs	HCl	14 Days
TPH as Stoddard Solvent (carbon range C7-C12)	Modified EPA 8015B	3 x 40 mL VOAs (C&T) 2 x 1L Amber (CAS)	HCl	14 Days
TPH as diesel [3] (carbon range C12-C24)	Modified EPA 8015B	1 x 1L Amber 2 x 1L Amber (CAS)	-	14 Days Extract
TPH as fuel oil [3] (carbon range C24-C36)	Modified EPA 8015B	1 x 1L Amber 2 x 1L Amber (CAS)	-	14 Days Extract
VOCs	EPA 8260B	3 x 40 mL VOAs	HCl	14 Days
VOCs (TCE only)	EPA 8260B	3 x 40 mL VOAs	HCl	14 Days
BTEX	EPA 8021B	2 x 40 mL VOAs	HCl	14 Days
PAHs	EPA 8310	2 x 1L Ambers	-	7 Days Extract
SVOCs	EPA 8270C	2 x 1L Ambers	-	7 Days Extract
OCP / PCBs	EPA 8081/8082	2 x 1L Ambers	-	7 Days Extract
Chlorinated Herbicides	EPA 8151A	2 x 1L Ambers	-	7 Days Extract
Arsenic (III and V) Speciation	EPA 1632 Mod	1 x 250 mL Plastic	HCl	28 Days
Mercury	EPA 7470	1 x 500 mL Plastic	HNO3	28 Days
Dissolved Metals (ICP) [4]	EPA 6010	1 x 500 mL Plastic	HNO3	6 Months
Dissolved Metals (ICP/MS) [4]	EPA 6020	1 x 500 mL Plastic	HNO3	6 Months
Dissolved Gases	RSK 175	3 x 40 mL VOAs	HCl	14 Days
Hexavalent Chromium	EPA 7196A	1 x 250 mL Plastic	-	24 Hours
Dissolved Lead [4]	EPA 7470	1 x 500 mL Plastic	HNO3	28 Days
Cyanide	EPA 335.2	1 x 1L Plastic	NaOH	14 Days
Sulfide	EPA 376.2	1 x 1L Plastic	NaOH+ZnOAc	7 Days
TDS [5]	EPA 160.1	1 x 1L Plastic	-	7 Days
TOC	EPA 415.2	3 x 40 mL VOAs	H_2SO_4	28 Days
TSS [5]	EPA 160.2	1 x 1L Plastic	-	7 Days
Perchlorate	EPA 314.0	1 x 250 mL Plastic	-	28 Days
NDMA	EPA 1625	2 x 1L Ambers	-	7 Days Extract
1,4-dioxane	EPA 8270C	2 x 1L Ambers	-	7 Days Extract
PBDE	EPA 1614	3 x 1L Ambers	-	7 Days Extract
General Chemistry				
Alkalinity [5]	EPA 310.1	1 x 1L Plastic	-	28 Days
Bicarbonate [5]	EPA 310.1	1 x 1L Plastic	-	28 Days
Carbonate [5]	EPA 310.1	1 x 1L Plastic	-	28 Days
Chloride [5]	EPA 300.0	1 x 1L Plastic	-	28 Days
Fluoride [5]	EPA 300.0	1 x 1L Plastic	-	28 Days
Nitrate as Nitrogen / Nitrite as Nitrogen [5]	EPA 300.0	1 x 1L Plastic	-	48 Hours
Nitrate as Nitrogen/ Nitrite as Nitrogen	EPA 353.2	1 x 125 mL Plastic	H_2SO_4	28 Days
Sulfate [5]	EPA 300.0	1 x 1L Plastic	-	28 Days

Notes
1 - Minimum sample volumes and holding times as specified by the project laboratory Curtis and Tompkins.
2 - All samples will be placed on ice and kept at an EPA prescribed temperature of 4 degrees Celsius.
3 - This analysis includes silica gel cleanup.
4 - Field filtration to be performed in the field using a 0.45 micron filter.
5 - All of these analyses can be taken from the same 1L plastic container.

Acronyms
BTEX - Benzene, Toluene, Ethylbenzene, and Xylenes
ICP - Inductively Coupled Plasma
ICP/MS - Inductively Coupled Plasma with Mass Spectography confirmation
NDMA - N-nitrosodimethylamine
OCPs - Organochlorine Pesticides
PAHs - Polycyclic Aromatic Hydrocarbons
PBDE - Polybrominated diphenyl ether
PCBs - Polychlorinated Biphenyls
SVOCs - Semi-Volatile Organic Compounds
TCE - Trichloroethene
TDS - Total Dissolved Solids
TOC - Total Organic Carbon
TPH - Total Petroleum Hydrocarbons
TSS - Total Suspended Solids
VOCs - Volatile Organic Compounds

- = No preservative

Notes

Edits shown in **bold** text were made on 1 April 2003 based on updated version of Table 7-6 of the QAPP, transmitted from Chris Nelson on 14 March 2003.

1 Water Quality Criteria is from Table 7-6 of the Cleanup Levels Document (EKI, 2002).

2 These are limits established in the QAPP (Tetra Tech, 2001).

- = not established

(a) Cleanup levels are based upon concentrations of COPCs that result in chronic toxicity to aquatic organisms, or to humans through consumption of water and fish, whichever is more stringent. Cleanup levels apply to surface water and groundwater that may exfiltrate directly to surface water, such as Lobos Creek, Mountain Lake, and the Tennessee Hollow Riparian Corridor upon enhancement.

Table 6
Water Quality Criteria and Analytical Reporting Limits
Presidio Groundwater Monitoring Program
Presidio of San Francisco, California

Notes (continued)

(b) Cleanup levels are based upon concentrations of COPCs that result in chronic toxicity to aquatic organisms. Cleanup levels apply to seeps and to groundwater that emerges as freshwater seeps.

(c) Cleanup levels are based upon concentrations of COCs that result in chronic toxicity to marine organisms. Cleanup levels apply to marine or salt water environments.

(d) Cleanup level listed is a promulgated or proposed federal Maximum Contaminant Level (MCL), or promulgated or proposed MCL or action level specific to the State of California. MCLs obtained from U.S. EPA Region IX, *Drinking Water Standards and Health Advisories Tables* , dated February 2000. Drinking water cleanup levels apply to groundwater and surface water at the Presidio.

(e) Cleanup level obtained from Title 40 of the Code of Federal Regulations, Part §131.38, *Establishment of Numerical Criteria for Priority Toxic Pollutants for the State of California* , or California Toxics Rule (CTR), promulgated 18 May 2000.

(f) Hyphen indicates that a cleanup level is not specified in Presidio Trust QAPP.

(g) Cleanup level obtained from California Environmental Protection Agency, Regional Water Quality Control Board, San Francisco Bay Region, *Water Quality Control Plan, San Francisco Bay Basin. San Francisco Bay Region* ("Basin Plan"), dated 21 June 1995.

(h) Cleanup level is a function of hardness. Value shown is based on a hardness of 100 mg/L as calcium carbonate.

(i) Cleanup level is expressed as a function of the water-effects ratio, as defined in the CTR.

(j) Cleanup level listed is a secondary MCL. Secondary MCLs apply to chemicals in drinking water that adversely affect its odor, taste, or appearance and therefore cause people to discontinue using the water.

(k) MCL based upon treatment technique. Treatment technique and public notification required at action level of 15 µg/L for lead.

(l) Cleanup level for mercury is 0.012 µg/L. However, this level is below the typical analytical method reporting limit of 0.025 µg/L. A cleanup objective of 0.012 µg/L is desirable, but attainment can only be determined at the analytical method reporting limit.

(m) Cleanup level for COC in total recoverable form.

(n) Cleanup level for COC corresponds to instantaneous maximum value.

(o) Cleanup level obtained from Montgomery Watson, *Fuel Product Action Level Development Report, Presidio of San Francisco, California* ("FPALDR").

Table 6
Water Quality Criteria and Analytical Reporting Limits
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

Notes (continued)

(p) This level is below the typical analytical method reporting limit range of 0.1 to 10 µg/L for semivolatile organic compounds. Cleanup level listed is desirable, but attainment can only be determined at the analytical method reporting limit. Cleanup level is established at the typical analytical method reporting limit range for semivolatile organic compounds assuming no matrix interference. In the event of matrix interference, actual method reporting limits determining compliance with cleanup levels may be raised.

(q) Cleanup level obtained from Montgomery Watson, *Development of Point of Compliance Concentrations (POCCs) for Gasoline in Surface Waters and Sediments of the Proposed Freshwater Stream, Presidio of San Francisco, California* , dated 4 May 1999. Numerical values based upon bioassay studies performed by RWQCB and review of toxicological data published in scientific literature.

(r) Cleanup level applies to total PCBs.

(s) Cleanup level is State of California action level for drinking water.

(t) This level is below the typical analytical method reporting limit range of 0.05 to 0.5 µg/L for PCBs and pesticides. Cleanup level listed is desirable, but attainment can only be determined at the analytical method reporting limit.

Notes
1 - The table has been reformatted to one dissolved metals column. The number of dissolved metals proposed for analysis are denoted by parentheses. For example, Q (23) indicates the 23 metals list should be analyzed on a quarterly basis. The metals associated with each metals list are detailed below.
23 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Hg, Ni, K, Ag, Na, Se, Th, V, and Zn.
22 Metals List - Al, Sb, As, Ba, Be, Cr, Cd, Ca, Co, Cu, Fe, Pb, Mg, Mn, Ni, K, Ag, Na, Se, Th, V, and Zn.
15 Metals List - Al, Sb, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
14 Metals List - Al, As, Ca, Cr, Cd, Cu, Fe, K, Mg, Mn, Na, Pb, Ni and Zn.
9 Metals List - As, Cr, Cd, Cu, Fe, Mn, Pb, Ni and Zn.
8 Metals List - As, Cr, Cd, Cu, Fe, Pb, Ni and Zn.
7 Metals List - As, Cr, Cd, Cu, Pb, Ni and Zn.
3 Metals List - Al, Fe, and Cr.
2 - TPH-G, TPH-D, TPH-FO: Total Petroleum Hydrocarbons as gasoline, diesel and fuel oil - EPA 3630A: Silica Gel Cleanup Step

Bold indicates samples that are duplicated at both the project and QC laboratories.

Notes
1 - General Chemistry Parameters include total alkalinity, bicarbonate, chloride, fluoride, nitrate, nitrite, sulfate, and total dissolved solids.
2 - TPH as fuel oil uses a motor oil standard for carbon range (C_{24}-C_{36}).
Table 11 identifies current and historical data qualifiers.

BTEX - benzene, toluene, ethylbenzene, and xylenes
MTBE - methyl tert-butyl ether
NA - Not analyzed
ND - Not detected above the laboratory reporting limit
TDS - total dissolved solids
TPH - total petroleum hydrocarbons
VOC - volatile organic compounds
mg/L - milligrams per liter
µg/L - micrograms per liter

Notes

1 - Metals include aluminum, arsenic, arsenite, arsenate, antimony, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, sodium, silver, selenium, thallium, vanadium, and zinc.

2 - TPH as fuel oil uses a motor oil standard for carbon range (C_{24}-C_{36}).

3 - Sample collected from source water tank on a field vehicle.

4 - Sample collected from the deionization system outlet at Blaine Tech Services, Inc. facility in San Jose, CA.

Table 11 identifies current and historical data qualifiers.

TDS - total dissolved solids
MBAS - methylene blue active substances
NA - Not analyzed
ND - Not detected above the laboratory reporting limit
OCPs - organochlorine pesticides
PAHs - polycyclic aromatic hydrocarbons
PCBs - polychlorinated biphenyls
SVOCs - semi-volatile organic compounds
TPH - total petroleum hydrocarbons
VOCs - volatile organic compounds
µg/L - micrograms per liter
mg/L - milligrams per liter

Table 11
Laboratory Qualifiers for Current and Historical Analytical Data
Presidio-wide Groundwater Monitoring Program
Presidio of San Francisco, California

The following data validation qualifiers were used for analytical data generated beginning in the Second Quarter 2001. Multiple data qualifiers can be applied to individual sample results. These qualifiers are recommended in the October 1999 document titled *USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*:

#	The continuing calibration verification (CCV) drifted outside the limits although the average CCV drift was within the limits per method requirements.
U	The analyte was analyzed for, but was not detected above, the reported sample quantitation limit.
J	The analyte was positively identified; the associated numerical value is the approximate concentration of the analyte in the sample, refer to the specific analytical report for the rationale behind the qualification.
J+	The analyte was positively identified; the associated numerical value is biased high due to a high surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
J-	The analyte was positively identified; the associated numerical value is biased low due to a low surrogate recovery and should be considered an approximate concentration of the analyte in the sample.
Jb	The analyte was identified below the laboratory reporting limit but above the laboratory method detection limit and QAPP-specified reporting limit.
N	The analysis indicates the presence of an analyte for which there is presumptive evidence to make a “tentative identification.”
NJ	The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
UJ	The analyte was not detected above the reported sample quantitation limit. However, the reported quantitation limit is approximate and may or may not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample.
R	The sample results are rejected due to serious deficiencies in the ability to analyze the sample and meet quality control criteria. The presence or absence of the analyte cannot be verified.

The current reported analytical data also includes the following laboratory supplied validation comments:

B	Analyte is found in the associated blank as well as in the sample.
C	Presence confirmed, but confirmation concentration differed by more than a factor of two.
H	Heavier hydrocarbons contributed to the quantitation.
HT-04	This sample was analyzed beyond the EPA recommended holding time. The results may still be useful for their intended purpose.
HT-RA	This sample was originally analyzed within the EPA recommended hold time. Re-analysis for confirmation or dilution was performed past the recommended hold time. The results may still be used for their intended purpose.

ndp	Hydrocarbon reported does not match the pattern of the diesel standard.
L	Lighter hydrocarbons contributed to the quantitation.
Y	Sample exhibits a fuel pattern, which does not resemble standard.
Z	Sample exhibits unknown single peak or peaks.

Analytical data reported prior to the second quarter of 2001 have used the same data qualifiers described above, but have also used the validation qualifiers and comments Q, Rd, DR, D, B, G, P, d, j, k, z. Descriptions of these previously used validation qualifiers and comments are provided in the quarterly monitoring report corresponding to the sampling date shown in the analytical summary tables.

The following is a table of data validation qualifiers and comments used by Montgomery Watson for their previous Presidio groundwater monitoring work.

Data Validation Qualifiers:

J – Qualified as estimated U – Qualified as not detected R – Qualified as rejected

Data Validation Comments:

1. Qualified due to detected concentration in associated method blank sample.
2. Qualified due to detected concentration in associated trip blank sample.
3. Qualified due to detected concentration in associated filter blank sample.
4. Qualified due to detected concentration in associated equipment rinsate blank sample.
5. Qualified as positively biased due to surrogate recoveries above the established acceptance limits.
6. Qualified as negatively biased due to surrogate recoveries below the established acceptance limits.
7. Qualified due to surrogate recoveries outside the established acceptance limits; bias cannot be determined.
8. Qualified as positively biased due to MS/MSD recoveries above the established acceptance limits.
9. Qualified as negatively biased due to MS/MSD recoveries below the established acceptance limits.
10. Qualified due to MS/MSD recoveries outside the established acceptance limits; bias cannot be determined.
11. Qualified as positively biased due to LCS recoveries above the established acceptance limits.
12. Qualified as negatively biased due to LCS recoveries below the established acceptance limits.
13. Qualified due to LCS recoveries outside the established acceptance limits; bias cannot be determined.
14. Qualified as positively biased due to calibration nonconformances.
15. Qualified as negatively biased due to calibration nonconformances.
16. Qualified due to calibration nonconformances; bias cannot be determined.
17. Qualified as negatively biased due to holding time nonconformances.
18. Qualified as negatively biased due to sample receipt nonconformances.
19. Qualified as positively biased due to sample receipt nonconformances.
20. Qualified due to sample receipt nonconformances; bias cannot be determined.

21. Qualified as positively biased due to other criteria.
22. Qualified as negatively biased due to other criteria.
23. Qualified due to other criteria; bias cannot be determined.
24. Qualified due to detected concentration in associated source water sample.
25. Qualified due to chromatographic pattern of the sample does not match the calibration pattern.
26. Reported value determined by method of standard addition; bias cannot be determined.
27. Qualified as negatively biased due to post-digest spike recovery between 40% and 85%.
28. Estimated value; result is detected between the method detection limit (MDL) and the reporting limit.
29. Qualified due to holding times exceeded.
30. Qualified as estimated; compound is a common laboratory contaminant.
31. Reported value determined by GC/MS library search; compound is tentatively identified and quantitation is estimated.
32. Qualified data explained further in the report associated with the sampling event.
33. Qualified to field duplicate RPD outside of established limits; bias cannot be determined.
34. Final purge readings are not representative of site conditions. The reported readings are taken from earlier entries associated with that purge log.
35. Questionable field parameter results; readings do not appear to be representative of site conditions.

APPENDIX A
Sampling Area Summaries

BUILDING 900s AREA
APPENDIX SECTION A-1
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 900s Area is located in the northern portion of the Presidio, adjacent to Crissy Field at the boundary of the San Francisco Bay, just southeast of the Golden Gate Bridge (Figure 1). The site is approximately 15 acres, with surface elevations ranging from approximately 10 to 15 feet above the Presidio lower low water (PLLW) datum (Montgomery Watson, 1996c).

Buildings in the Building 900s Area were associated with aviation maintenance activities for Crissy Field, which was built in 1919, and a formerly active Coast Guard Station (Figure A-1-1). Building uses shifted from airfield maintenance to vehicle maintenance in 1936. Building uses of concern include: a former motor pool repair shop, transformer storage, a solvent dip tank, bulk oil and waste oil storage, automotive bodywork, painting, battery storage, a former fuel pump house, fuel storage, steam cleaning, an underground oil-water separator, aircraft maintenance, a boiler house, equipment storage, vehicle maintenance, waste oil/solvent storage, a fueling area, and mine storage (Montgomery Watson, 1997a). Documented potential sources of environmental concern are surface spills associated with vehicle maintenance and waste oil storage and subsurface releases from underground storage tanks (USTs) and associated piping (Dames & Moore, 1997).

Groundwater samples collected from site wells have previously been analyzed for total petroleum hydrocarbons (TPH) as gasoline (TPHg), TPH as diesel (TPHd), TPH as fuel oil (TPHfo), volatile organic compounds (VOCs), and dissolved metals. Dissolved metals analysis has not been a part of the Building 900s Area monitoring program since 1997. Summaries of dissolved oxygen, TPH, and VOC results can be found in Tables A-1-1 through A-1-3.

The Coast Guard Station is located adjacent to and southeast of the site and has three associated monitoring wells, CGGW01, CGGW02, and CGGW03 (Figure A-1-1). The Coast Guard station is no longer included in the Presidio-wide Groundwater Monitoring Program. Prior groundwater sampling of these wells did not detect any concentrations of TPHg, TPHd, TPHfo or metals above laboratory detection limits and sampling was subsequently discontinued in 1996. Coast Guard Station groundwater analytical results for TPH and lead are summarized in Table A-17-1 in Appendix A of the *Draft Quarterly Groundwater Monitoring Annual Summary Report, Fourth Quarter 2001* (Treadwell & Rollo, 2002d).

A reduction in sampling frequency for all Building 900s Area wells to annual was previously approved by the stakeholders and sampling was only conducted at the site during the First Quarter 2006.

2.0 SITE DESCRIPTION AND GEOLOGY

Unconsolidated deposits encountered during previous site investigations in the Building 900s Area include three units: fill material, estuarine sand deposits with local interbedded fine-grained estuarine deposits, and Franciscan Complex bedrock.

Prior to remediation activities, the Building 900s Area consisted mostly of artificial fill with isolated areas of debris fill. The artificial fill was a mixture of sand, silt, and clay composed primarily of dredged sand from San Francisco Bay (used to fill historic wetlands beneath Crissy Field) and serpentinite and/or chert gravel used as road base. The debris fill was composed of silt and sand mixed with construction debris, including concrete, wood, glass, brick fragments, and wire (Dames & Moore, 1997). Fill materials range in thickness from 1.5 to 7 feet.

The fill materials are underlain by native estuarine sands interbedded with fine-grained estuarine deposits. The sand thickness extends up to approximately 50 feet, and the interbedded, fine-grained sediments range in thickness from 1 inch to 2.5 feet. Shell fragments and layers of organic material (including peat) up to 0.9 feet thick are locally present. At the location of former well 937GW01, adjacent to the serpentinite cliff that borders the site to the west and southwest, silty clay with sand and gravel (weathered serpentinite) extends to at least 35 feet below ground surface (bgs).

The laterally continuous, shallow, fine-grained estuarine deposits (also known as Bay Mud), which separate shallow water-bearing sand units to the southeast in the Building 637 Area (described in Appendix A, of the *Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2004*, Treadwell & Rollo, 2004c), are not present beneath the Building 900s Area. Interbedded, fine-grained sediments are discontinuous and mostly occur locally north of Building 937.

The estuarine sediments are underlain by Franciscan Complex bedrock, predominantly serpentinite. The massive serpentinite outcrop exposed along the western portion of the Building 900s Area forms a cliff approximately 60 feet above ground surface (Figure A-1-1). At the base of the cliff, the serpentinite bedrock dips below ground surface and the depth to bedrock generally increases from the cliff to San Francisco Bay, with the maximum encountered depth at approximately 50 feet bgs.

A single, heterogeneous, unconfined (water table) coastal aquifer is present beneath the Building 900s Area. The water table beneath the Building 900s Area has, in the past, typically ranged from 6 to 9 feet bgs. The thickness of the aquifer increases as the depth to bedrock increases from the serpentinite cliff on the west side of the site toward San Francisco Bay (Figure A-1-1).

The Building 900s Area monitoring wells are generally screened in estuarine sand deposits of the aquifer, with some wells screened partially in fine-grained lenses or in weathered serpentinite bedrock. Because the site wells are screened in a single water table aquifer without discrete water-bearing zones, the wells are separated into three groups based on relative screened elevation rather than water-bearing zones. These screened intervals are referred to as the shallow, intermediate, and deep.

Groundwater in the Crissy Field Groundwater Area (Figure 1) generally flows north to northeast toward San Francisco Bay, with locally divergent flow directions (Montgomery Watson, 1999a). In the northwestern portion of the Building 900s Area, the historical coastal features influence the hydrogeology in the shallow interval by diverting groundwater flow (and contaminant migration) northwest and north along the historic lagoonal water channel (Montgomery Watson, 1997b), rather than northeast directly toward the bay. All three intervals have similar groundwater elevations.

3.0 REMEDIAL ACTION PLAN

In April 1998, the Department of Toxic Substances Control (DTSC) approved the Crissy Field Remedial Action Plan (RAP). The Crissy Field RAP addressed multiple Crissy Field area contamination sites, including the Building 900s Area. For the Building 900s Area, the Crissy Field RAP selected source soil removal and subsequent confirmation groundwater monitoring to ensure that contaminant concentrations do not exceed applicable standards. Approximately 39,000 tons of contaminated soil and fill were excavated and removed (Army and DTSC, 1998). The Crissy Field RAP requires that groundwater monitoring be conducted for a minimum of five years following construction completion, and that, should contamination concentrations exceed applicable standards for two consecutive quarters, the data be reviewed with the stakeholders and an action plan developed and implemented to address the groundwater contamination. Seventeen additional monitoring wells were installed between 19 and 29 June 2001 to expand the monitoring well network for this area (Figure A-1-1). The Crissy Field RAP identifies the following groundwater cleanup levels for this area:

Cis-1,2-dichloroethene (cis-1,2-DCE)	140,000 micrograms per Liter (µg/L)
Trans-1,2 dichloroethene (trans-1,2-DCE)	140,000 µg/L
Trichloroethene (TCE)	81 µg/L
Vinyl chloride	525 µg/L

In addition, five-year reviews of groundwater use in this area are required to ensure that no human use is occurring without appropriate treatment. These reviews are to continue until the groundwater meets drinking water standards or is no longer classified as a “potential drinking water source.” In May 2002, monitoring well 937GW108 was installed at the Building 937 Area as requested by the DTSC, and on 14 May 2002, dry well 979GW111 was replaced with monitoring well 979GW111R. This completed the monitoring well network required by the Crissy Field RAP.

4.0 GROUNDWATER MONITORING

The Building 900s Area has 28 associated monitoring wells (Figure A-1-1). Work at the site is currently being performed in accordance with the *Crissy Field RAP* and the *Field Sampling Plan* (FSP) (Treadwell & Rollo, 2001a). In accordance with Tables 1A and 1B, First and Second Quarter 2006 groundwater elevations were collected from all Building 900s Area wells and the annual groundwater sampling was conducted in the First Quarter 2006.

4.1 Groundwater-Level Measurements and Interpretation

Building 900s Area monitoring wells are screened in three different intervals of the single aquifer present. These screened intervals are referred to as shallow, intermediate, and deep zones and are differentiated by relative screen depths. A complete list of site wells, their associated water-bearing zones, and historical groundwater elevations, are presented in Table A-1-4. All groundwater elevation measurements for the First and Second Quarters 2006 were manually collected on 6 March and 22 May 2006, respectively. Water level meters were calibrated on 6 March and 22 May 2006 and calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the First Quarter 2006, all site wells were gauged between 12:34 PM and 2:00 PM on 6 March 2006. Low tide was predicted to be at 11:12 AM on 6 March 2006. Observed low tide on 6 March 2006 occurred at 11:08 AM, with a magnitude of 0.8 feet above PLLW.

During the Second Quarter 2006, all site wells were gauged between 2:25 PM and 3:25 PM. Low tide was predicted to be at 8:12 PM on 22 May 2006. Observed low tide on 22 May 2006 occurred at 8:06 PM with a magnitude of 0.79 feet PLLW. Tidal predictions and observations are taken from the National Oceanic and Atmospheric Administration's (NOAA) Center for Operational Oceanographic Products and Services website. Predicted and observed tidal times and magnitudes during the First and Second Quarters 2006 are presented in Tables 2A and 2B, respectively.

4.1.1 Shallow Groundwater

During the First Quarter 2006, shallow groundwater elevations at the Building 900s Area ranged from 4.31 to 8.04 feet above PLLW in monitoring wells 979GW110 and 937GW12/937GW108, respectively. The majority of groundwater elevations measured during the First Quarter 2006 were slightly higher than the historical elevations. Seven of the eight shallow monitoring wells located in the southern portion of the site and three of the six wells on the northern portion of the site had new high elevations measured (Table A-1-4). The new high groundwater elevations can be attributed to the relatively large amount of rainfall the area received during the First Quarter 2006. The First Quarter 2006 shallow groundwater flow direction in the northern portion of the Building 900s Area was generally northwesterly along the historic lagoonal channel while the groundwater flow direction in the southern portion of the site was northeasterly towards San

Francisco Bay (Figure A-1-2). The average groundwater gradients for the shallow monitoring wells in the northern and southern portions of the site were estimated to be approximately 0.007 and 0.016 feet per foot, respectively.

During the Second Quarter 2006, shallow groundwater elevations at the Building 900s Area ranged from 3.71 to 6.42 feet above PLLW in monitoring wells 937GW12 and 937GW108, respectively. The Second Quarter 2006 shallow groundwater flow direction in the northern portion of the Building 900s Area was generally northwesterly along the historic lagoonal channel while the groundwater direction in the southern portion of the site was northeasterly towards San Francisco Bay (Figure A-1-3). The average groundwater gradients for the shallow monitoring wells in the northern and southern portions of the site were estimated to be approximately 0.004 and 0.006 feet per foot, respectively.

Shallow groundwater flow directions and gradients are generally consistent with those previously reported for the Building 900s Area.

4.1.2 Intermediate Groundwater

During the First Quarter 2006, intermediate groundwater elevations at the Building 900s Area ranged from 4.12 to 6.26 feet above PLLW in monitoring wells 979GW110 and 937GW102, respectively. The First Quarter 2006 intermediate groundwater flow direction was northeasterly towards San Francisco Bay (Figure A-1-4). The average groundwater gradient for the intermediate monitoring wells in the Building 900s Area was estimated to be approximately 0.008 feet per foot.

During the Second Quarter 2006, intermediate groundwater elevations at the Building 900s Area ranged from 0.71 to 5.09 feet above PLLW in monitoring wells 979GW110 and 937GW102, respectively. The Second Quarter 2006 intermediate groundwater flow direction in the Building 900s Area was northeasterly (Figure A-1-5). The average groundwater gradient observed in intermediate monitoring wells in the Building 900s Area was estimated to be approximately 0.004 feet per foot.

Intermediate groundwater flow directions and gradients are generally consistent with those previously reported for the Building 900s Area.

4.1.3 Deep Groundwater

During the First Quarter 2006, deep groundwater elevations at the Building 900s Area ranged from 4.21 to 6.23 feet above PLLW in monitoring wells 979GW117 and 937GW38, respectively. The deep groundwater flow direction was northerly (Figure A-1-6), with an average groundwater gradient of approximately 0.006 feet per foot.

During the Second Quarter 2006, deep groundwater elevations at the Building 900s Area ranged 1.10 to 5.55 feet above PLLW in monitoring wells 979GW117 and 937GW38, respectively. The deep groundwater flow direction was north-northwesterly (Figure A-1-7). The average groundwater gradient was calculated to be approximately 0.004 feet per foot.

Deep groundwater flow directions and gradients are generally consistent with those previously reported at the Building 900s Area.

4.1.4 Vertical Gradients

Building 900s Area vertical gradients are presented in Table A-1-5. Vertical groundwater gradients were calculated for three well clusters each having one shallow, intermediate, and deep well: 900WC-1, 900WC-2, and 900WC-3. Well clusters 900WC-1 and 900WC-2 are located northeast of Building 937 (Figure A-1-1). Well cluster 900WC-3 is located in the northern portion of the site. A description of which wells are contained in each well cluster and a description of how the vertical gradients were calculated can be found in Table A-1-5.

During First Quarter 2006 vertical gradients were observed as follows:

- A downward (positive) vertical gradient was observed between the shallow/intermediate intervals and shallow/deep intervals within well clusters 900WC-1, 900WC-2, and 900WC-3, and the intermediate/deep intervals within well cluster 900WC-2 and 900WC-3.
- An upward (negative) vertical gradient was observed between the intermediate/deep intervals within well cluster 900WC-1.

During Second Quarter 2006 vertical gradients were observed as follows:

- A downward (positive) vertical gradient was observed between the shallow/intermediate intervals within well cluster 900WC-1 and 900WC-3, intermediate/deep intervals within well clusters 900WC-1 and 900WC-2, and shallow/deep intervals within well clusters 900WC-1 and 900WC-2.
- An upward (negative) vertical gradient was observed between the shallow/intermediate intervals within well cluster 900WC-2, and intermediate/deep and shallow/deep intervals within well cluster 900WC-3.

The vertical gradients observed during the First and Second Quarters 2006 are generally consistent with previous findings. The vertical gradients between the shallow/intermediate and shallow/deep intervals are generally slightly to moderately downward with the intermediate/deep varying more between upward and downward flow.

4.2 Monitoring Well Purging and Sampling

All 28 of the Building 900s Area monitoring wells that were proposed for sampling during the First Quarter 2006 were purged and sampled between 9 and 15 March 2006, in accordance with methods shown in Table 1A and procedures described in the FSP (Treadwell & Rollo, 2001a). No monitoring wells in the Building 900s Area were scheduled to be sampled during the Second Quarter 2006 (Table 1B).

Purge equipment and volumes, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon above-ground polyethylene storage tanks located at the Central Magazine.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from the Building 900s Area monitoring wells during the First Quarter 2006 sampling event were analyzed for VOCs, TPHg, TPHd, and TPHfo. Additionally, dissolved oxygen was measured within each well prior to sampling. The TPHfo standard currently being used is a TPH motor oil standard, as defined by the Presidio QAPP, with a carbon range of C_{24} to C_{36}. Section 5.4.3.1 in the main text discusses the data compatibility issues associated with TPH analyses.

5.1 Dissolved Oxygen

Dissolved oxygen concentrations are summarized in Table A-1-1. Concentrations of dissolved oxygen measured during the First Quarter 2006 were generally within the historical range previously measured within Building 900s Area wells, with the exception of new highs measured in 937GW12 and 937GW106 and the new lows measured within 937GW101, 937GW108 and 979GW111R. The new high measured at 937GW12 is significantly higher than recent dissolved oxygen concentrations and may be anomalous. The other new low and high concentrations are just outside the range of historical concentrations and can be attributed to natural fluctuations.

Dissolved oxygen concentrations were measured using either a down-hole or in-line dissolved oxygen meter during the First Quarter 2006. A discussion of dissolved oxygen measurement procedures and data comparability can be found in Section 5.4.1 of the main report.

5.2 VOCs Results

During the First Quarter 2006, VOCs were detected in shallow, intermediate, and deep groundwater (Figures A-1-8 through A-1-10). The Crissy Field RAP specifies cleanup levels for cis-1,2-DCE, trans-1,2-DCE, TCE, and vinyl chloride. At least one of these VOC compounds was detected in samples collected from 17 of the 28 monitoring wells sampled during the First

Quarter 2006. All VOC concentrations detected during First Quarter 2006 were significantly below RAP specified cleanup levels (Table A-1-2).

The table below summarizes new high and low VOC concentrations detected during the First Quarter 2006 when compared to previous analytical results and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Volatile Organic Compounds							
937GW105	Cis-1,2-Dichloroethene	15 / 15	0.6	1	--	2.4	µg/L
	Vinyl Chloride	3 / 16	< 0.5	3.3	--	3.9	µg/L
937GW107	Trans-1,2-Dichloroethene	15 / 15	1.3	8.4	--	8.5	µg/L
937GW108	Chlorobenzene	14 / 15	0.8	53	< 0.5	--	µg/L
950GW108	1,2-Dichloroethene (Total)	3 / 3	160	170 *	--	280 *	µg/L
979GW110	Cis-1,2-Dichloroethene	7 / 14	< 0.5	6.6	--	6.7	µg/L
	Vinyl Chloride	1 / 14	< 0.5	< 0.5	--	0.9	µg/L
979GW111R	Cis-1,2-Dichloroethene	10 / 10	4.2	14	3.9	--	µg/L
979GW113	Cis-1,2-Dichloroethene	11 / 14	< 0.5	7.4	--	11	µg/L
	Trichloroethene	12 / 14	< 0.5	3.1	--	3.9	µg/L
	Vinyl Chloride	4 / 14	< 0.5	0.7	--	0.8	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Cis-1,2-DCE, trans-1,2-DCE, TCE, and vinyl chloride had new high concentrations reported slightly above previous high concentrations. Monitoring wells with potentially increasing or decreasing concentrations and monitoring wells with concentrations significantly lower or higher than previous concentrations are discussed below.

TCE was detected at shallow well 979GW113 with a new high concentration of 3.9 µg/L, compared to the previous high of 3.1 µg/L, but well below the RAP-specified cleanup level of 81 µg/L.

Cis-1,2-DCE was detected at a concentration of 2.4 µg/L, above the previous maximum of 1 µg/L, in intermediate monitoring well 937GW105. Additionally, cis-1,2-DCE was detected at 11 µg/L, above the previous maximum of 7.4 µg/L, in shallow monitoring well 979GW113 during the First Quarter 2006. These values are well below the RAP-specified cleanup level of 180,000 µg/L.

Vinyl chloride was detected at a concentration of 3.9 µg/L within intermediate monitoring well 937GW105 during the First Quarter 2006. Vinyl chloride was first detected in this well during the First Quarter 2004 at a concentration of 0.5 µg/L, and was also detected at 3.3 µg/L during

the First Quarter 2005. Prior to these sampling events, vinyl chloride had not been detected above the laboratory reporting limit within this well. Vinyl chloride was also detected at intermediate well 979GW110, for the first time, at a concentration of 0.9 µg/L during the First Quarter 2006.

Total 1,2-DCE was detected at a new high concentration of 280 µg/L at intermediate well 950GW108. However, total 1,2-DCE has been reported only three times by the QC laboratory and cis- and trans-1,2-DCE concentrations are within historical ranges.

VOC concentrations at the Building 900s Area have remained relatively stable at low concentrations, within the monitoring wells sampled prior to the First Quarter 2002. Concentrations of VOCs in the monitoring wells that were added to the monitoring program beginning in the First Quarter 2002 have been more varied, but have remained well below RAP-specified cleanup levels.

In general, during natural biodegradation, TCE is dehalogenated and converted into two isomers, cis- and trans-1,2-DCE. The processes that convert TCE to either cis- or trans-1,2-DCE are highly variable and depend on specific field conditions. Generally, during natural biodegradation, the cis-1,2-DCE isomer is found at higher concentrations than trans-1,2-DCE. Monitoring wells with detections of cis- or trans-1,2-DCE during the First Quarter 2006 had higher concentrations of cis-1,2-DCE than trans-1,2-DCE except monitoring wells 937GW101 (shallow), 937GW102 (intermediate), and 979GW111R (intermediate). Cis- and trans-1,2-DCE can be further dehalogenated to form vinyl chloride. In the majority of samples that contained cis- and trans-1,2-DCE, vinyl chloride was present at lower concentrations. The relative concentration ratios of cis- and trans-1,2-DCE, and vinyl chloride in the samples continue to indicate that natural biodegradation processes are occurring.

5.3 TPH Results

TPH was only detected in shallow monitoring wells 937GW108 and 950GW108 during the First Quarter 2006 (Table A-1-3). TPHg and TPHd were detected within 937GW108 at concentrations of 140 and 55 µg/L, respectively. The detected concentration of TPHg within 937GW108 during this quarter is the lowest to date, while the concentration of TPHd is slightly above the laboratory's reporting limit of 50 µg/L. TPHd was detected, for the first time, at 120 µg/L in the QC duplicate sample collected from 950GW108, but was not detected in the primary or the duplicate samples associated with this well and had not been detected during previous quarters within this well.

TPHg and TPHd are not listed in the Crissy Field RAP as contaminants of concern and do not have specified cleanup levels relative to the Building 900s Area.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during First and Second Quarters 2006 are consistent with historical values and interpretations. VOC concentrations detected during the First Quarter 2006 did not exceed their respective RAP-specified cleanup levels. The majority of VOC concentrations detected during the First Quarter 2006 were within the range of previously detected concentrations. The only monitoring well with significantly higher VOC concentrations was shallow well 950GW108, which had a higher concentration of total 1,2-DCE detected than in any previous monitoring event.

The relative concentration ratios of TCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride within Building 900s groundwater samples continue to indicate that natural biodegradation processes are occurring. The ratios of TCE, cis-1,2-DCE, trans-1,2-DCE, and vinyl chloride will continue to be monitored in future events.

TPHg and TPHd were detected in the shallow monitoring well 937GW108 sample at concentrations of 140, and 55 µg/L, respectively. The detected TPH concentrations within 937GW108 were at or near their lowest historical concentrations. TPHd was detected for the first time at 950GW108, but only in the duplicate sample at a concentration of 120 µg/L.

The sampling frequency at the Building 900s Area will continue to be annual per the Crissy Field RAP. The first five-year review will be completed in 2007.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Final RAP, Crissy Field Area* , Presidio of San Francisco, California (Army, Headquarters, I Corps, and Fort Lewis and California DTSC, 1998).
Concentrations in **BOLD** indicate an exceedance of applicable cleanup levels.
µg/L - micrograms per liter
ND - Not Detected
NA - Not analyzed
1,2-DCE - 1,2-Dichloroethene
Cis-1,2-DCE - cis-1,2-Dichloroethene
Trans-1,2-DCE - trans-1,2-Dichloroethene
MTBE - Methyl tert-butyl ether
TCE - Trichloroethene
PCE - Tetrachloroethene
VOC - Volatile organic compound
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
-- - Clean up concentrations not established.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.
H - Heavier hydrocarbons contributed to the quantitation
L - Lighter hydrocarbons contributed to the quantitation
Y - Sample exhibits fuel pattern which does not resemble standard
NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
ndp - Hydrocarbon reported does not match the pattern of the diesel standard.
µg/L - micrograms per liter
NA - Not analyzed
TPH - Total petroleum hydrocarbons
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Table A-1-4
Groundwater Elevation Summary
Building 900s Area
Presidio of San Francisco, California

Well ID	Date	Tidal Cycle	Average Depth to Water [1] (feet)	Top of Casing Elevation (feet PLLW)	Groundwater Elevation (feet PLLW)	Well Type
979GW117	11/26/01	High	9.67	12.17	2.50	MW
	08/27/01	Low	8.61	12.17	3.56	MW
	08/27/01	High	8.54	12.17	3.63	MW

Notes
1- All depth to water measurements are an average of three measurements recorded in the field.
2 - Top of casing elevation is approximate due to damaged casing.
3 - This depth to water (7.68 feet) was measured on 4 June 2002 during sampling.
4 - This depth to water (9.19 feet) was measured at approximately 10:30 AM on 18 March 2003 during sampling.
MW - Monitoring well
-- = Groundwater level measurements were not collected on a tidal schedule beginning with Fourth Quarter 2003.
NM - Not measured
feet PLLW - feet above Presidio Lower Low Water vertical datum.

	979GW117	Deep	03/04/02	3.23	12.59	40.0	-27.41									

Notes

feet PLLW - feet above Presidio Lower Low Water vertical datum.

bgs - below ground surface

1 - Groundwater elevations are presented in Table A-1-4.

2 - The screen midpoint elevations are calculated by subtracting the depth to the screen midpoint from the ground surface elevation (Montgomery Watson, 1999i).

3 - Vertical gradients are calculated by dividing the vertical difference in groundwater elevations between two adjacent wells screened in different vertical locations within the water-bearing zone by the vertical difference between the midpoint elevations of the two well screens (Table 3). The value for the shallower well is subtracted from that of the deeper well. A positive value indicates a downward vertical gradient, while a negative number indicates an upward vertical gradient. For the groundwater and screen midpoint elevations, the absolute difference between the elevations and depths are calculated.

LANDFILL 8
APPENDIX SECTION A-2
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill 8 is located in the southwestern portion of the Presidio (Figure 1) in the vicinity of the U.S. Public Health Services Hospital (PHSH). The site elevation (Figure A-2-1) is approximately 250 feet above PLLW in the northeast and approximately 190 feet above PLLW in the southwest (Montgomery Watson, 1996c). In 1874, the PHSH was established as a full-service U.S. Merchant Marine Hospital and laboratory. The U.S. Public Health Services took control of the facility in 1927 and operated the hospital until it was closed in November 1981 (Montgomery Watson, 1996c). Landfill 8 was used between the years of 1946 and 1973 to dispose of vegetative debris, miscellaneous building debris, and some garbage and clean fill (Woodward Clyde Consultants, 1990; USACE, 1990).

Groundwater samples have been collected from Landfill 8 monitoring wells since September 1994. Previous laboratory analyses of the groundwater samples included general chemistry, cyanide, metals, volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), and chlorinated herbicides. No PAHs, OCPs, PCBs, or chlorinated herbicides have been detected above laboratory reporting limits at Landfill 8 since monitoring began in September 1994. Summaries of previous dissolved oxygen, general chemistry, cyanide, PAH, OCP, PCB, chlorinated herbicide, VOC, and metals results can be found in Tables A-2-1 through A-2-3.

A reduction in sampling frequency for all Landfill 8 wells to annual was previously approved by the stakeholders; thus, sampling was only conducted during the First Quarter 2006, in accordance with the approved plan (Table 1A).

2.0 SITE DESCRIPTION AND GEOLOGY

Landfill 8 is a part of the Lobos Creek Groundwater Basin (Figure 1). Groundwater is found at approximately 10 to 50 feet bgs and flows to the southeast. Soils beneath Landfill 8 consist of unconsolidated Colma Formation sedimentary deposits of sand, silt, and clay. These deposits are underlain by Franciscan Formation bedrock (Montgomery Watson, 1996c).

3.0 PUBLIC HEALTH SERVICE HOSPITAL RECORD OF DECISION

In early 1995, the U.S. Army completed the Record of Decision (ROD) for the Former PHSH Area (PHSH ROD). The PHSH ROD addressed three remediation sites within the PHSH Area, including Landfill 8. The selected remedy was quarterly groundwater monitoring for five years to confirm that chemicals are not leaching from the fill material to the groundwater.

The quarterly monitoring program at Landfill 8 has met the requirements of the PHSH ROD. The *Five Year Review and Field Investigation Work Plan for Landfills 8 and 10* was finalized in October 2002. In order to evaluate remedial actions undertaken in accordance with the 1995 PHSH ROD, the Trust will determine whether a ROD amendment or an Explanation of Significant Differences will be required for future site remediation. Potential future remedial actions to be completed at Landfill 8 include construction of a permeable landfill cover or partial landfill removal. A landfill delineation study was completed at Landfill 8 in November 2002. Results of the study will be used in the selection of the final remedy for the site (URS, 2002).

The *Five Year Review and Final Investigation Report for Landfills 8 and 10* (FYR) was submitted to the regulatory agencies and RAB in January 2004. A Focused Feasibility Study (FFS) for Landfills 8 and 10 has been prepared. Additionally, the Trust is currently preparing a RAP and designing new remedial actions for the two landfill sites. The Draft RAP is scheduled to be completed in 2007.

4.0 GROUNDWATER MONITORING

Landfill 8 has five associated monitoring wells and two piezometers (Figures A-2-1 and A-2-2). Groundwater elevations were collected from all area wells and piezometers during the First and Second Quarters 2006, in accordance with Tables 1A and 1B. Groundwater samples were collected from the five Landfill 8 monitoring wells during the First Quarter 2006 and analyzed for the parameters described in Section 5.0.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006 at the five Landfill 8 monitoring wells and two piezometers during the First and Second Quarters 2006. A summary of groundwater elevations is presented in Table A-2-4. Water level meters were calibrated on 6 March and 22 May and the calibration logs can be found in Appendix B. Groundwater elevation field forms are presented in Appendix C.

First Quarter 2006 groundwater elevations ranged from 175.69 to 225.12 feet above PLLW in monitoring wells LF08GW02B and LF08PZ01, respectively. Groundwater flow was determined to be in a southeasterly direction, which follows the general topographic trend. The groundwater gradient was calculated to be approximately 0.11 feet per foot. A groundwater elevation map showing the First Quarter 2006 groundwater contours and flow direction for Landfill 8 is

included as Figure A-2-1. Groundwater gradients and flow directions are consistent with previous findings at the site.

Second Quarter 2006 groundwater elevations ranged from 180.52 to 225.69 feet above PLLW in monitoring wells LF08GW02B and LF08PZ01, respectively. Groundwater flow was determined to be in a southeasterly direction, which follows the general topographic trend. The groundwater gradient was calculated to be approximately 0.10 feet per foot. A groundwater elevation map showing the Second Quarter 2006 groundwater contours and flow direction for Landfill 8 is included as Figure A-2-2. Groundwater gradients and flow directions are consistent with previous findings at the site.

4.2 Monitoring Well Purging and Sampling

The five Landfill 8 monitoring wells were purged and sampled on 16 or 17 March 2006 during the First Quarter 2006. Landfill 8 monitoring wells were purged and sampled using the methods shown in Table 1A and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a). Groundwater sampling was not proposed for the Landfill 8 monitoring wells during the Second Quarter 2006 (Table 1B).

Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this Appendix A section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses proposed in Table 1A. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed during the First Quarter 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples were collected from the five Landfill 8 monitoring wells (LF08GW01, LF08GW02B, LF08GW03, LF08GW04, and LF08GW06) during First Quarter 2006. The monitoring wells were analyzed for general chemistry parameters, OCPs, PCBs, VOCs, PAHs, total sulfide, cyanide, and 23 dissolved metals, in accordance with the proposed sampling schedule (Table 1A). Current and historical analytical results are presented in Tables A-2-1 through A-2-3. In addition, groundwater from Landfill 8 monitoring wells was measured in the field for oxidation-reduction potential (ORP), pH, temperature, and dissolved oxygen prior to

sampling, as part of the low flow sampling procedure. Temperature, ORP and pH data can be found on the groundwater sampling forms associated with Landfill 8 monitoring wells.

5.1 Dissolved Oxygen

Dissolved oxygen measurement results are summarized in Table A-2-1. The concentrations of dissolved oxygen measured within Landfill 8 monitoring wells during the First Quarter 2006 are within the range of historical concentrations. Dissolved oxygen was measured with an in-line dissolved oxygen meter during the First Quarter 2006.

5.2 General Chemistry, Cyanide, and Sulfide Results

General chemistry, cyanide, and sulfide results are presented in Table A-2-1. Most general chemistry results from the First Quarter 2006 were within the range of previously detected concentrations within Landfill 8 Area monitoring wells.

The table below summarizes the general chemistry results that were outside the range of previous values for Landfill 8 wells, and provides the range and frequency of historical results (Table A-2-1). The total number of analyses may vary depending on the sampling frequency, the initial date of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
LF08GW01	Alkalinity, Total	36 / 36	128	192	--	220	mg/L
	Bicarbonate	36 / 36	128	187	--	220	mg/L
	Chloride	36 / 36	76.6 *	220	--	240	mg/L
LF08GW03	Bicarbonate	29 / 30	< 5	244	--	290	mg/L
LF08GW06	Chloride	12 / 12	169	262 *	140	--	mg/L
	Sulfate	12 / 12	80 *	145 *	78	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

The sample concentrations detected outside the range of previous values were only slightly higher or lower than previously detected results and can be attributed to natural concentration fluctuations that are not considered significant.

Sulfide results for Landfill 8 monitoring well samples collected during the First Quarter 2006 were rejected during data validation due to a MS/MSD percent recovery failure.

Cyanide was detected in the duplicate sample collected from LF08GW04 at a concentration of 0.03 mg/L, slightly above the detection limit of 0.01 mg/L. Cyanide was not detected in the LF08GW04 primary sample. Cyanide was previously detected in the Landfill 8 wells during the Second Quarter 2002 in monitoring well LF08GW06 (0.02 J- mg/L) and during the Third

Quarter 2003 in a QC sample collected from monitoring well LF08GW01 (0.005 J- mg/L). The J- concentration qualification indicates that the detected concentration was biased low during data validation due to a low surrogate recovery (Table 11). The surface water cleanup level for cyanide is 0.0052 mg/L as listed in Table 7-6 of the Cleanup Levels Document. This cleanup level for cyanide is applicable to Landfill 8 groundwater due to the potential for groundwater to discharge exfiltrate directly to surface water. Groundwater samples from Landfill 8 monitoring wells LF08GW04 (First Quarter 2006) and LF08GW06 (Third Quarter 2003) have exceeded the applicable cleanup level for cyanide. Cyanide has been below laboratory detection in most previous and subsequent sampling events conducted at Landfill 8. However, the laboratory reporting limit has consistently been at 0.01 mg/L, which exceeds the applicable cyanide cleanup level of 0.0052. Future detections of cyanide will continue to be monitored and trends identified as they become apparent.

5.3 PAHs, OCPs, PCBs, and Chlorinated Herbicides

No PAHs, OCPs, PCBs, or chlorinated herbicides, were detected in Landfill 8 groundwater samples collected during the First Quarter 2006. PAHs, OCPs, PCBs, or chlorinated herbicides have never been detected within Landfill 8 monitoring wells (Table A-2-2).

5.4 Dissolved Metals Results

Dissolved metals results are presented in Table A-2-3. Dissolved metals results during the First Quarter 2006 are generally within historical ranges. The table below summarizes the results of dissolved metal analyses that were outside the range of previous historical values for Landfill 8 samples (Table A-2-3). The total number of analyses may vary depending on the sampling frequency, the initial date of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
LF08GW01	Calcium	35 / 35	15,200	41,700	--	43,000	µg/L
	Sodium	36 / 36	36,900	140,000	--	150,000	µg/L
LF08GW06	Calcium	13 / 13	33,000	61,500	23,000	--	µg/L
	Magnesium	13 / 13	31,400	40,000	22,000 *	--	µg/L
	Sodium	13 / 13	150,000 *	206,000	140,000	--	µg/L
	Total Dissolved Solids	12 / 12	660	3,800	600	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

The new high and low concentrations are only slightly higher or lower than previously detected and can be attributed to natural concentration fluctuations that are not considered to be significant.

5.5 VOCs Results

VOCs were not detected in Landfill 8 groundwater samples collected during the First Quarter 2006 (Table A-2-2). Historically, tetrachloroethylene (PCE), dichloromethane and/or toluene have been detected sporadically at relatively low concentrations within Landfill 8 monitoring wells LF08GW01, LF08GW03 and LF08GW04. PCE was detected at monitoring well LF08GW01 (0.5 µg/L) during the First Quarter 2005, dichloromethane was detected at LF08GW01 (0.69 µg/L) during the First Quarter 2004, and toluene was detected at LF08GW01 (0.81 µg/L), LF08GW03 (0.72 µg/L), and LF08GW04 (1.0 µg/L) during the Third Quarter 1996.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during First and Second Quarters 2006 are consistent with historical values and interpretations. The five Landfill 8 monitoring wells were sampled and analyzed during the First Quarter 2006 (annual basis) according to the proposed sampling schedule. Most general chemistry results from the First Quarter 2006 were within the range of previously detected concentrations within Landfill 8 Area monitoring wells.

Cyanide was detected in the duplicate sample collected from LF08GW04 at a concentration of 0.03 mg/L, slightly above the detection limit of 0.01 mg/L. Cyanide has been detected only three times since groundwater monitoring began in the mid-1990s. Groundwater samples from Landfill 8 monitoring wells LF08GW04 (0.03 mg/L) from the First Quarter 2006 and LF08GW06 (0.02 J- mg/L) from the Third Quarter 2003 exceed the applicable cleanup level for cyanide of 0.0052 mg/L. Future detections of cyanide will continue to be monitored and trends identified as they become apparent.

Sulfide results for Landfill 8 monitoring well samples collected during the First Quarter 2006 were rejected during data validation due to a MS/MSD percent recovery failure.

No OCPs, PCBs, or chlorinated herbicides were detected in the Landfill 8 groundwater samples collected during First Quarter 2006, nor have they been historically detected above the laboratory reporting limits. VOCs were not detected in Landfill 8 groundwater samples collected during the First Quarter 2006.

No other significant trends or observations were identified at Landfill 8 during First Quarter 2006. The sampling frequency at Landfill 8 has been reduced to annual monitoring, until the Landfill 8 RAP is finalized and implemented. Sampling at Landfill 8 will then be performed per the Landfill 8 RAP requirements.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Total dissolved solids analysis was mistakenly not marked on the chain-of-custody by the field team and was therefore not analyzed by the laboratory.
3 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO_3 concentrations (nitrate-NO_3) which are 4.43 times higher than nitrate-N concentrations. Section 6.2.1.2 in the main report of the *Draft Semi-Annual Groundwater Monitoring Report, First and Second Quarters 2003, Presidio-Wide Quarterly Groundwater Monitoring Program* discusses this issue (Treadwell & Rollo, 2003e).
mg/L - milligrams per liter
NA - not analyzed
NM - not measured
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
µg/L - micrograms per liter
NA - not analyzed
ND - not detected
PAHs - polycyclic aromatic hydrocarbons
OCPs - organochlorine pesticides
PCE - tetrachloroethylene
PCBs - polychlorinated biphenyls
VOC - volatile organic compound
MTBE - methyl tert-butyl ether
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
mg/L - milligrams per liter
µg/L - micrograms per liter
NA - not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - Piezometer was covered in landscaping material and was not located during the survey.
NL - not located
NA - not available
MW- Monitoring Well
PZ - Piezometer
feet PLLW - feet above Presidio Lower Low Water vertical datum

LEGEND

LF08GW02B 175.69 — Groundwater Monitoring Well, March 2006 Groundwater Elevation

LF08PZ02 211.33 — Piezometer, March 2006 Groundwater Elevation

* — Monitoring well not used in contouring, screened in bedrock.

Approximate Direction of Groundwater Flow

Groundwater Elevation Contour (Contour Interval : 5 ft)

Approximate Lateral Extent of Landfill

1830 — Previously Removed Building

Topographic Contour (Contour Interval : 10 ft)

Notes:
Groundwater elevation data collected on 6 March 2006.

Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet

Vertical Datums: (groundwater) Presidio Lower Low Water (ft. PLLW) (topography) North American Vertical Datum, NAVD88

FILL SITE 6
APPENDIX SECTION A-3
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Fill Site (FS) 6 is located in the northeastern portion of the Presidio (Figure 1). The topography across FS 6 is relatively flat and covered by buildings, streets, paved areas, and landscaping. The site ground surface elevation ranges from approximately 10 to 40 feet above the PLLW datum (Montgomery Watson, 1997a).

FS 6 is bounded by Lincoln Boulevard to the south, Halleck Street to the west, General Kennedy Avenue to the east, and Doyle Drive to the north (Figure A-3-1). FS 6 is reported to contain building debris from the original Letterman Army Medical Center, which was demolished in 1975, as well as a variety of other buildings. During construction of the parking lot east of Building 1028 in the 1980s, some building debris was discovered (Dames & Moore, 1997). In the southwest corner of the site, a mounded area relative to the adjacent areas (FS 6A), was formerly present and contained PCB-impacted soil (EKI, 2003).

The Trust installed four monitoring wells (LF6GW100, LF6GW101, LF6GW102, and LF6GW103) in July 2000 to investigate whether FS 6 contains soluble concentrations of chemicals of concern that adversely affect groundwater quality, and to investigate the possibility that fill materials extend west of Girard Road (EKI, 2003). As discussed in Section 3.0, FS 6 was divided into two portions, FS 6A and FS 6B (Figure A-3-1). In FS 6A, polychlorinated biphenyl's (PCBs) and mercury were present in soil above applicable cleanup levels. In preparation for the FS 6A remedial action, monitoring well LF6GW102 was abandoned in the First Quarter 2005. Remedial excavation was completed in September 2005 at FS 6A. Prior to the First Quarter 2006, the Trust installed six piezometers (LF6PZ101 through LF6PZ106) at FS 6A as described in Section 3.0.

Groundwater samples collected from FS 6 monitoring wells (Figure A-3-1) have been analyzed for general chemistry, dissolved oxygen, total organic carbon (TOC), total petroleum hydrocarbons as gasoline (TPHg), TPH as diesel (TPHd), dissolved gases (ethane, ethene and methane), polycyclic aromatic hydrocarbons (PAHs), organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), 23 dissolved metals, and arsenic speciation. Additionally, monitoring well 231GW09 was added to the FS 6 monitoring plan to serve as a downgradient well for FS 6A and has been sampled for general chemistry, dissolved oxygen, volatile organic compounds (VOCs), MTBE, TPHg, TPHd, TPH as fuel oil (TPHfo), and dissolved metals. Groundwater analytical results are presented in Tables A-3-1 through A-3-5.

To evaluate changing redox conditions, pH, temperature and oxygen-reduction potential (ORP) were added to the program in the First Quarter 2006. The *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006), concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-3-2 and will be used in the ongoing redox evaluations at CAP sites.

2.0 SITE DESCRIPTION AND GEOLOGY

FS 6 is located in the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Depth to groundwater ranges from approximately 6 to 22 feet bgs, based on groundwater monitoring well data. Groundwater level data indicate groundwater flow is generally to the north, towards the San Francisco Bay.

During the drilling of the RI soil borings in the eastern portion of FS 6, two lithologic units were encountered in the area. Underneath the paved areas west of Building 1028, the upper layer consists of fill material extending to a maximum depth of 7 feet bgs. The fill was found to include wood, bricks, concrete, ceramic tiles, asphalt roofing materials, and buckshot (Montgomery Watson, 1999b). The fill is believed to consist largely of building demolition debris. Below the fill is clayey silty sand to well-sorted sand with minor clay layers of the Colma Formation, which is consistent with geologic mapping of the area conducted by Schlocker (Schlocker, 1974). The Franciscan Formation is estimated to be present at approximately 175 feet bgs in this area.

Lithologic units encountered in the southwestern corner of FS 6 include an upper layer of fill material extending to an approximate depth of 15 or more feet, underlain by slope debris, ravine fill, and Colma Formation deposits. The fill consists largely of building demolition debris in a sand matrix and ranges from minor debris to significant sand and concrete foundations and rubble.

3.0 REMEDIAL ACTION PLAN

The *Remedial Action Plan* (RAP) *for Fill Site 6A and Baker Beach Disturbed Areas 3 and 4*, selected excavation, recycling, and offsite disposal of impacted fill material and underlying soil, along with groundwater monitoring, as the remedial alternative for FS 6A (Figure A-3-1). The goal of the remediation at FS 6A will be to remove all contaminated material, leaving in place soil that meets the established cleanup levels (Treadwell & Rollo, 2003c).

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes and residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to

comply with the water quality protection standards or the cleanup levels presented in Section 3 of the RAP for three years. Table 3 from the RAP summarizes groundwater cleanup levels applicable to FS 6A. These cleanup levels are based on the most stringent values for protecting drinking and surface waters. RAP-specified groundwater cleanup levels for some analytes are slightly lower than their QAPP analytical reporting limits. Applicable RAP-specified cleanup levels are listed on site data tables A-3-1 through A-3-5.

Based on the availability of new data associated with the Building 1065 Study Area, FS 6 has been divided into two portions, FS 6A and FS 6B (Figure A-3-1). FS 6A addresses the portion of FS 6 bounded by Lincoln Boulevard to the south, Girard Avenue to the east, the area just west of the buildings to the west of Halleck Street, and a sidewalk between Building 227 and 1030 to the north. In FS 6A, PCBs and mercury were formerly present in soil above applicable cleanup levels. The remainder of FS 6, consisting of FS 6B, will be subject to an evaluation of data and potential remedial action alternatives in a future decision document (Treadwell & Rollo, 2003c).

Pre-excavation activities for FS 6A began in winter 2004 and excavation began in May 2005. Prior to remediation excavation activities and the Second Quarter 2005 sampling event, monitoring well LF6GW102 was abandoned. The FS 6A remedial excavation was completed in September 2005. Following completion of excavation activities, three new wells (LF6GW104 through LF6GW106) were installed per the RAP and six new piezometers (LF6PZ101 through LF6PZ106) were installed to monitor water levels related to stream restoration at locations shown on Figure A-3-1. The six new piezometers were constructed using hand-held equipment and were installed directly into native soil. Because no sand pack or grout material was used in the construction of the piezometers, it was subsequently determined that development was not required.

The installation of the new wells and piezometers completes the FS 6A RAP groundwater well monitoring network, which consists of both new and existing wells. The proposed groundwater monitoring program and rationale is presented in Table 10 of the RAP. The six piezometers are monitored quarterly for groundwater elevations starting the First Quarter 2006.

4.0 GROUNDWATER MONITORING

During the First Quarter 2006, groundwater elevations were measured and samples were collected from the seven FS 6 monitoring wells (LF6GW100, LF6GW101, LF6GW103 through LF6GW106, and 231GW09) (Table 1A). During the Second Quarter 2006, groundwater elevations were measured at the seven monitoring wells and samples collected at five FS 6 wells (LF6GW103 through LF6GW106, and 231GW09) (Table 1B). Beginning with the Second Quarter 2003, the sampling frequency and analytical suite for monitoring well 231GW09 was modified to serve as a downgradient well for FS 6A. Additionally, the six new piezometers used to gauge water levels associated with FS 6A stream restoration were monitored during the First and Second Quarters 2006.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevations at the FS 6A shallow aquifer monitoring wells were evaluated with Building 231/207 and Building 1065/1027 shallow monitoring wells to better understand groundwater flow direction and gradients in this area. Current and historical FS 6 water elevations are presented in Table A-3-6. Monitoring well data for these adjacent sites can be found in Tables A-10-3 and A-11-4, respectively. A discussion of groundwater elevation trends in the FS 6 and Building 1065 vicinity can be found in Section 5.1 in Appendix A-11.

Groundwater elevation measurements were collected on 6 March and 22 May 2006. During the First Quarter 2006, groundwater elevations, within FS 6A and associated wells, ranged from 11.32 to 20.27 feet above PLLW in monitoring wells LF6GW103 and LF6GW105, respectively (Figure A-3-2). During the Second Quarter 2006, groundwater elevations ranged from 11.26 to 20.64 feet above PLLW in monitoring wells LF6GW103 and LF6GW105, respectively (Figure A-3-3). The water level measurements from the six new piezometers ranged in elevation from 9.52 to 13.08 feet above PLLW, during the First and Second Quarters 2006. These water levels are associated with surface stream water levels are shallower than site groundwater levels, and therefore, they were not used to create groundwater contours.

During the First and Second Quarters 2006, the groundwater flow direction in the FS 6 and surrounding areas was generally north-northeast, towards the San Francisco Bay following the general topographic trend (Figures A-3-2 and A-3-3). The First and Second Quarter 2006 groundwater gradients beneath the footprint of FS 6A were estimated to be approximately 0.013 feet per foot. The overall groundwater gradients and flow directions observed at FS 6A during the First and Second Quarters 2006 are consistent with previous findings.

4.2 Monitoring Well Purging and Sampling

The First Quarter 2006 sampling at FS 6 occurred on 15, 17 and 20 March 2006. The Second Quarter 2006 sampling occurred 23 and 24 May 2006. The First and Second Quarters 2006 sampling at FS 6 were conducted in accordance with methods shown in Tables 1A and 1B of the main text and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5.

Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the First and Second Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Current and historical analytical results are presented in Tables A-3-1 through A-3-5. During the First Quarter 2006 groundwater samples were collected from the seven FS 6 associated monitoring wells. During the Second Quarter 2006, groundwater samples were collected at five FS 6 wells (LF6GW103 through LF6GW106, and 231GW09). Monitoring wells LF6GW104 through LF6GW106 were only sampled for the third time during the Second Quarter 2006 and therefore, new highs and low concentration trends are not discussed for these wells.

During the First Quarter 2006, groundwater samples collected from the seven FS 6 monitoring wells were analyzed for TOC, 23 dissolved metals, TDS, total sulfide and general chemistry. Additionally, redox (pH, ORP and temperature) parameters were measured. LF6GW100, LF6GW101, and LF6GW103 were also analyzed for PAHs, OCPs, PCBs, TPHg and TPHd. Groundwater samples collected from LF6GW104 and LF6GW106 were additionally analyzed for PAHs, TPHd and TPHfo. Groundwater samples collected from 231GW09 were also analyzed for VOCs, TPHg, TPHd and TPHfo. The VOCs results are provided and discussed as part of the Building 207/231 Area (A-10).

During the Second Quarter 2006, groundwater samples were collected from five FS 6 monitoring wells and analyzed for 23 dissolved metals, TDS, and general chemistry and redox (pH, ORP and temperature) parameters. Monitoring wells LF6GW100 and LF6GW101 were not scheduled for sampling during the Second Quarter 2006. LF6GW103 was also analyzed for PAHs, OCPs, PCBs, TPHg and TPHd. Groundwater samples collected from LF6GW104 and LF6GW106 were additionally analyzed for PAHs, TPHd and TPHfo and samples collected from 231GW09 were analyzed for VOCs, TPHg, TPHd and TPHfo.

ORP, pH, and temperature were measured in the field and results are presented in Table A-3-2.

The following sections discuss analytical results collected at FS 6 during the First and Second Quarters 2006.

5.1 Dissolved Oxygen Results

Dissolved oxygen was measured in wells sampled during the First and Second Quarters 2006. Dissolved oxygen results are presented in Table A-3-2. During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.52 to 4.15 mg/L at monitoring wells

LF6GW105 and LF6GW101, respectively. During the Second Quarter 2006, dissolved oxygen was measured at LF6GW104 and 231GW09 at concentrations ranging from 0.42 and 2.64 mg/L. These levels are within historical ranges previously measured at FS 6.

5.2 General Chemistry Results

The majority of the general chemistry parameter results measured during the First and Second Quarters 2006 are within or near historical ranges. Four FS 6 monitoring wells had new high and/or low concentrations of general chemistry parameters during the First and Second Quarters 2006. The new high/low concentrations detected are only slightly outside of historical highs or lows and can be attributed to the small number of sampling events at some locations and to natural fluctuation. An evaluation of the redox state of site groundwater and relative general chemistry results is presented in Section 6.0.

5.3 TPH Results

TPHd was detected only in well LF6GW103 at a concentration of 76 µg/L during the Second Quarter 2006 (Table A-3-1). TPHd was previously detected during the Third Quarter 2001 at LF6GW100 (at 60 µg/L) and LF6GW102 (at 57 µg/L) and during the Second Quarter 2004 at 231GW09 (at 170 µg/L). TPHd has not exceeded RAP cleanup levels to date within any FS 6 monitoring wells sampled. TPHg and TPHfo have not been detected in FS 6 groundwater samples analyzed for these analytes.

5.4 OCP and PCB Results

No OCPs or PCBs were detected in the LF6GW100, LF6GW101, and LF6GW103 FS 6 monitoring well samples collected during the First and Second Quarters 2006 as shown in Table A-3-2.

5.5 PAH Results

No PAHs were detected in FS 6 wells LF6GW100, LF6GW101, LF6GW103, LF6GW104 and LF6GW106 , during the First and Second Quarters 2006 as shown in Table A-3-2.

5.6 Dissolved Metals and TDS Results

Dissolved metals results are presented in Table A-3-3. The table below summarizes new high and low dissolved metals and TDS analytical results from the First and Second Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed. Only the new high or new low data are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
LF6GW100	Magnesium	21 / 21	43,000	230,000	41,000 *	--	µg/L
	Sodium	21 / 21	28,000	120,000	27,000	--	µg/L
LF6GW101	Sodium	15 / 15	55,000	250,000	52,000	--	µg/L
	Total Dissolved Solids	15 / 15	400	560	--	600	mg/L
LF6GW103	Calcium	25 / 25	37,000	59,000 *	31,000	--	µg/L
	Chromium	28 / 28	27	37 *	26	--	µg/L
	Magnesium	26 / 26	57,000	270,000	49,000 *	--	µg/L
	Potassium	23 / 26	< 5,000 *	1,300	< 500 *	--	µg/L
	Sodium	26 / 26	65,000	300,000	59,000	--	µg/L
	Total Dissolved Solids	26 / 26	560	760	430	--	mg/L
231GW09	Barium	16 / 16	46	58	31	61	µg/L
	Calcium	17 / 17	22,000	60,200	15,000	--	µg/L
	Magnesium	17 / 17	39,000	60,700	24,000	--	µg/L
	Sodium	16 / 16	62,000	129,000	42,000	--	µg/L
	Total Dissolved Solids	26 / 26	420	790	320 *	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Several new low and two new high concentrations were detected within FS 6 samples during the First and Second Quarters 2006. However, the detected concentrations are not considered significant since none exceeded groundwater cleanup levels specified in the RAP for dissolved metals (Treadwell & Rollo, 2003c), as shown on Table A-3-3.

As discussed in the RAP (Treadwell & Rollo, 2003c), selenium was retained as a potential chemical of concern (PCOC) because of a single-time exceedance, which was believed to be an artifact of sampling. Zinc was also considered as a PCOC due to cleanup level exceedances that may have been solely due to inadequate filtering of samples prior to analysis. Selenium has not been detected at LF6GW102 since 2000 or at any other FS 6 locations. Zinc has not exceeded its cleanup level since the Third Quarter 2002.

An evaluation of the redox state of site groundwater and relative dissolved metals results can be found in Section 6.0.

5.7 TOC and Dissolved Gas Results

Groundwater samples from FS 6A monitoring wells LF6GW100, LF6GW101, LF6GW103 through LF6GW106, and 231GW09 were analyzed for TOC during the First Quarter 2006. TOC analytical results are presented in Table A-3-5.

Dissolved gasses were removed from the program for the evaluation of redox conditions in accordance with recommendations from the *Technical Memorandum, Evaluation of Arsenic and*

Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California (MACTEC, 2006). An evaluation of the redox state of site groundwater and relative dissolved gas and TOC results can be found in Section 6.0.

5.8 Arsenic Speciation Results

Arsenic speciation analysis (Table A-3-4) was removed from the program for the evaluation of redox conditions in accordance with recommendations from the *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006). An evaluation of the redox state of site groundwater can be found in Section 6.0.

6.0 GROUNDWATER REDOX EVALUATION

Several parameters were measured in the field and in the laboratory to help evaluate the redox state of groundwater at FS 6. The following parameters were included in the groundwater monitoring program at FS 6 during the First Quarter 2005 and are indicators of changing redox potential within groundwater. Analytes and their use, in terms of determining the current redox state of site groundwater, are listed below.

- **Dissolved Oxygen** – Dissolved oxygen is a field measurement that is collected using a flow through cell or a down-hole probe. Low dissolved oxygen concentrations are typically associated with low redox potential and reducing environments. Dissolved oxygen in the presence of organic carbon is consumed by microorganisms during biodegradation processes and therefore low dissolved oxygen concentrations are indicative of microbial activity.

- **Nitrate/Nitrite** – The process of denitrification reduces nitrate to nitrite, which is ultimately reduced to nitrogen gas in reducing environments. A decreasing nitrate concentration trend in groundwater can be indicative of low redox potential, microbial metabolism and a reducing environment. Increasing concentrations of nitrate are typically associated with a rising redox potential.

- **Sulfate/Sulfide** – Decreasing concentrations of sulfate indicate sulfate reduction is taking place due to a reducing environment. Decreasing concentrations of sulfate are usually associated with sulfide production (i.e. sulfide is a product of sulfate reduction) and the repeated presence of sulfide in groundwater further confirms that sulfate is being reduced.

- **TOC** – Decreasing trends in TOC over time indicate that microbial metabolism is taking place and TOC is being consumed.

- **Dissolved Arsenic, Iron and Manganese** – Increasing concentrations of arsenic, iron, and/or manganese can be typically associated with a decreasing redox potential. Decreasing concentrations of these metals in association with increasing sulfate concentrations can be associated with an increasing redox potential.

The above analytes and field measurements were collected within all FS 6 associated monitoring wells proposed for sampling during the First Quarter 2006.

The following analytical results were detected during the First and Second Quarters 2006 and provide an indication of the groundwater redox state at FS 6.

- Dissolved oxygen was measured in all monitoring wells during the First and Second Quarters 2006. During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.52 to 4.15 mg/L at monitoring wells LF6GW105 and LF6GW101, respectively. During the Second Quarter 2006, dissolved oxygen was measured at LF6GW104 and 231GW09 at concentrations ranging from 0.42 and 2.64 mg/L. These levels are within historical ranges (Table A-3-2).

- Nitrate was detected at concentrations of 0.42 and 0.64 mg/L within monitoring wells LF6GW100 and LF6GW101, respectively, and at a concentration of 4.6 mg/L within monitoring well LF6GW105 during the First Quarter 2006. Nitrate was detected at concentrations of 5.7, 8.7, and 11 mg/L within monitoring wells LF6GW104, LF6GW106 and 231GW09, respectively, during the Second Quarter 2006 (Table A-3-2).

- Nitrite was not detected within any FS 6 monitoring wells during the First and Second Quarters 2006 (Table A-3-2).

- Sulfate was detected at concentrations ranging from 35 to 270 mg/L within FS 6 monitoring wells during the First Quarter 2006. Sulfate was detected at concentrations ranging from 68 to 210 mg/L within FS 6 monitoring wells during the Second Quarter 2006 (Table A-3-2).

- Sulfide was detected within monitoring well LF6GW100 at a concentration of 0.2 mg/L during the First Quarter 2006. Sulfide was not detected in any other FS 6 monitoring wells during the First and Second Quarters 2006 (Table A-3-2).

- ORP was measured during the First Quarter 2006 ranging from -249.2 mV to 205 mV within monitoring wells LF6GW101 and LF6GW100, respectively. ORP was measured during the Second Quarter 2006 ranging from 33.7 mV to 103.5 mV within monitoring wells 231GW09 and LF6GW106, respectively (Table A-3-2).

- TOC was detected during the First Quarter 2006 in all samples in which it was analyzed at concentrations ranging from 0.88 to 3.5 mg/L within monitoring wells 231GW09 and

LF6GW100, respectively (Table A-3-5). These levels are within historical ranges for FS 6 monitoring wells.

In addition to the above evaluation, modified redox diagrams were developed for each FS 6 monitoring well sampled. The redox diagrams were generated using the Sequence™ program and concentrations of dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figure A-3-4. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment.

7.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at FS 6 during the First and Second Quarters 2006.

No RAP-specified cleanup levels were exceeded during either the First or Second Quarters 2006 within the FS 6 wells sampled.

TPHd was detected within well LF6GW103 at a concentration of 76 µg/L during the Second Quarter 2006. TPHd continues to remain below the RAP cleanup levels to date within FS 6 monitoring wells.

No OCPs or PCBs were detected within FS 6 monitoring wells during the First and Second Quarters 2006. However, aldrin was detected in monitoring well LF6GW103 in the Third Quarter 2005 at a concentration of 0.05 µg/L and dieldrin was detected in well LF6GW100 at a concentration of 0.1 µg/L. These levels exceeded the FS 6 RAP-specified cleanup level; therefore, OCP concentrations will continue to be evaluated during future sampling events.

No PAHs were detected in FS 6 wells during the First and Second Quarters 2006.

Several new high or low concentrations of dissolved metals were detected within FS 6 samples during the First Quarter 2006. However, the majority of the metal concentrations detected were generally within historical ranges.

Dissolved oxygen, nitrate, nitrite, sulfate, sulfide, and TOC were measured during the First and Second Quarters 2006. At many locations, these parameters were only measured for the first or second time, therefore these parameters should continue to be monitored during future sampling events to identify apparent trends.

Notes
Shading indicates applicable cleanup levels.

[1] Cleanup levels for soil in the Ecological Special Status Species Zone are based on the most stringent of the values for protection of human health (residential land use), protection of ecologial receptors (ecological special status species), protection of ecological receptors (freshwater aquatic organisms), and maintaining drinking water standards in groundwater (soil less than or greater than 5 feet above groundwater, as applicable). In the case of metals, if the background metals concentration for Colma lithology is greater than the most stringest cleanup level, then the background concentration applies as the cleanup level. Source: Table 7-2 (non-petroleum compounds) and Table 7-5 (petroleum hydrocarbons and constituents) in Cleanup Levels Document (EKI, 2002).

[2] Cleanup levels for groundwater are based on the most stringent of the values for maintaining water quality criteria for drinking water and surface water. Source: Table 7-6 in Cleanup Levels Document (EKI, 2002).

[3] Values shown in parentheses applies if depth to groundwater at sampling location is less than 5 feet.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - From Table 3 of the RAP (Treadwell & Rollo, 2003c).
3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.
µg/L - micrograms per liter
NA - Not analyzed
TPH - Total petroleum hydrocarbons
H - Heavier hydrocarbons contributed to the quantitation.
Y - Sample exhibits a fuel pattern that does not resemble the standard
Z - Sample exhibits unknown single peak or peaks.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - From Table 3 of the RAP (Treadwell & Rollo, 2003c). RAP cleanup levels only apply to wells LF6GW103, LF6GW104, LF6GW105, and 231GW09.
µg/L - micrograms per liter
mg/L - milligrams per liter
C° - degrees centigrade
mV - millivolts
ND - Not detected
NR - Not reported
OCPs - Organochlorine pesticides
ORP - Oxidation-reduction potential
PAHs - Polycyclic aromatic hydrocarbons
PCBs - Polychlorinated biphenyls
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
Bold - indicates value above cleanup levels (see note 2 above).
-- Cleanup level not established
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - From Table 3 of the RAP (Treadwell & Rollo, 2003c).
3 - Due to computer/review error by the laboratory, sample 231GW09 was not analyzed by ICP-MS for the list of 22 metals. The sample had already been disposed of when the omission was discovered.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
Bold numbers indicate concentrations that exceed cleanup levels.
-- Cleanup level not established.

Presidio of San Francisco, California

Location ID	Sample Date	Inorganic Arsenic (As)	Arsenite (As III)	Arsenate (As V) [2]	Percentage of As III	Percentage of As V
	Analytical Method[1]	1632M	1632M	1632M	--	--
		(µg/L)	(µg/L)	(µg/L)	%	%
Cleanup Levels [3]		**10**	--	--	--	--
LF6GW100	04/04/05	0.792	< 0.025 U	0.792	0	100
LF6GW101	04/04/05	1.22	< 0.025 U	1.22	0	100
LF6GW102	04/04/05	0.851 J	0.483 J	0.368 J	57	43
LF6GW103	04/05/05	0.386 J	< 0.025 U	0.386 J	0	100
DUP0405053A	04/05/05	0.397 J	< 0.025 U	0.397 J	0	100
231GW09	08/31/05	0.405 J	< 0.025 JU	0.405 J	0	100
	06/01/05	0.371	< 0.025 U	0.371	0	100
	04/04/05	0.344	< 0.025 U	0.344	0	100

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
2 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration. As III has been detected at greater concentrations than inorganic As, due to analytical variability. As V is reported as non-detect when As III is detected at a greater concentration than inorganic As.
3 - From Table 3 of the RAP (Treadwell & Rollo, 2003c).
-- Cleanup level not established.
µg/L - micrograms per liter
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

BATTERY HOWE/WAGNER
APPENDIX SECTION A-4
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Battery Howe/Wagner is located in the northwestern portion of the Presidio (Figure 1). The site ground surface elevation is approximately 175 to 220 feet above the PLLW datum. The five-acre site is bounded by Battery Wagner Road on the north and east, Upton Avenue to the west, and Ruckman Avenue to the south (Figure A-4-1).

Battery Howe/Wagner was the first 12-inch mortar fortification established in San Francisco (Dames & Moore, 1997). The fortification was constructed in 1893. The date the Battery Howe/Wagner site was decommissioned is unknown, although aerial photographs indicate the site was covered with fill some time between 1963 and 1968. Potential sources of contamination reportedly exist within the debris fill (Montgomery Watson, 1997a).

Erler & Kalinowski, Inc. (EKI) installed three new monitoring wells (HWGW100, HWGW101, and HWGW102) at Battery Howe/Wagner in July 2000 (Figure A-4-1). These groundwater monitoring wells were constructed between Building 1233 and existing monitoring wells BHWGW01, BHWGW04, and BHWGW05 to evaluate whether historical releases of carbon tetrachloride or other volatile organic compounds (VOCs), formerly stored within Building 1233, have occurred (EKI, 2000a). Monitoring wells HWGW100 and HWGW101 were installed, developed, and sampled using low-flow sampling methodologies in July 2000. Groundwater was not observed in monitoring well HWGW102 during drilling, well construction or during subsequent monitoring events. Therefore, groundwater samples have never been collected from monitoring well HWGW102.

Groundwater sampling events have taken place at Battery Howe/Wagner since August 1992 and samples have been analyzed for VOCs, dissolved and total metals, hexavalent chromium, and general chemistry parameters. Hexavalent chromium analysis was replaced by dissolved aluminum, chromium and iron analyses beginning with the Second Quarter 2003. Additional dissolved metals (19) were added to the sampling and analysis program beginning with the Second Quarter 2006.

Currently, the sampling and analysis schedule (Tables 1A and 1B) for the Battery Howe/Wagner wells includes annual monitoring of VOCs and quarterly monitoring of dissolved metals and general chemistry parameters. Oxygen-reduction potential (ORP), pH and temperature are also being measured in the field as part of the low-flow sampling technique. Current and historical analytical results are presented in Tables A-4-1 and A-4-3.

2.0 SITE DESCRIPTION AND GEOLOGY

Battery Howe/Wagner is in the Marina Groundwater Basin (Montgomery Watson, 1996c). Depth to groundwater ranges from approximately 11 to 30 feet bgs. Groundwater flow is generally toward the northeast, but has been reported as both to the east and north (Dames and Moore, 1997).

Artificial and debris fill material lie beneath the Battery Howe/Wagner site at depths ranging from approximately 2.5 to 25 feet bgs. The artificial fill material consists of poorly sorted clay, silt, sand, and gravel, with various types of rock. The debris fill consists mainly of clay and silt with varying amounts of building materials, including glass, wood, brick, concrete, metal strips, and wire. Colma Formation sediments are present below the fill materials and consist of two distinct units: a silty clay colluvium ranging from 0 to 16 feet thick, and a dune sand ranging up to 7 feet thick. Franciscan Formation bedrock underlies the Colma Formation.

3.0 GROUNDWATER MONITORING

Battery Howe/Wagner has six associated monitoring wells (Figure A-4-1). During the First and Second Quarters 2006, groundwater elevation measurements were collected at all Battery Howe/Wagner monitoring wells, with HWGW102 being dry during both quarters. During the First and Second Quarters 2006, groundwater samples were collected from five of the Battery Howe/Wagner monitoring wells (BHWGW01, BHWGW04, BHWGW05, HWGW100 and HWGW101) and analyzed for dissolved metals and general chemistry parameters. In addition, samples were collected and analyzed for VOCs during the First Quarter 2006.

3.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006 at site wells except for HWGW102 which was dry. Groundwater elevations are summarized in Table A-4-4. The groundwater elevations measured at the Battery Howe/Wagner site are generally within the range of historical elevations. Water-level meters were calibrated on 6 March and 22 May 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the First Quarter 2006 groundwater elevations ranged from 162.85 to 189.84 feet above PLLW in monitoring wells BHWGW01 and HWGW101, respectively. Groundwater flow was in a northeasterly direction during the First Quarter 2006, which follows the general topographic trend (Figure A-4-1).

During the Second Quarter 2006, groundwater elevations ranged from 160.65 to 191.72 feet above PLLW in monitoring wells BHWGW01 and HWGW101, respectively. Groundwater flow

was in a northeasterly direction during the Second Quarter 2006, which follows the general topographic trend (Figure A-4-2).

The First and Second Quarter 2006 groundwater gradients were estimated to be approximately 0.058 and 0.055 feet per foot, respectively. Monitoring well HWGW102 was not used in the groundwater contouring or gradient calculation during either the First and Second Quarters 2006 because it was dry. Groundwater gradients and flow directions are consistent with previous findings at the site.

3.2 Monitoring Well Purging and Sampling

During the First and Second Quarters 2006, five of the six Battery Howe/Wagner site monitoring wells (BHWGW01, BHWGW04, BHWGW05, HWGW100, and HWGW101) were purged and sampled on 15 and 16 March and 25 May 2006, respectively. The remaining well (HWGW102) was dry during both the First and Second Quarters 2006 and was not sampled. All Battery Howe/Wagner monitoring wells containing water were sampled using methods shown in Tables 1A and 1B, and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water general water chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

3.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers collected from each well are described in the purge records located at the conclusion of this section.

Quality assurance and quality control (QA/QC) samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed for the First and Second Quarters 2006.

4.0 GROUNDWATER ANALYTICAL RESULTS

During the First Quarter 2006, groundwater samples were collected from the five monitoring wells (BHWGW01, BHWGW04, BHWGW05, HWGW100, and HWGW101) and analyzed for VOCs, three dissolved metals (aluminum, chromium and iron) and general chemistry parameters. During the Second Quarter 2006, groundwater samples were collected from the five wells and analyzed for 22 dissolved metals and general chemistry parameters.

4.1 Dissolved Oxygen

Dissolved oxygen measurements taken during the First and Second Quarters 2006 at Battery Howe/Wagner wells were within historical ranges (Table A-4-1).

4.2 General Chemistry Results

The table below summarizes new high and low general chemistry analytical results for the First and Second Quarters 2006 when compared to historical data, and provides the range and frequency of historical results (Table A-4-1). The total number of analyses may vary depending on the sampling frequency, the commencement date of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
BHWGW01	Nitrate	25 / 25	5.5	11.1	5.2	--	mg/L
BHWGW04	Alkalinity, Total	13 / 13	290	330	210	--	mg/L
	Bicarbonate	13 / 13	290	330	210	--	mg/L
HWGW100	Alkalinity, Total	10 / 10	730	1,200	590	--	mg/L
	Bicarbonate	10 / 10	730	1,200	590	--	mg/L
	Chloride	10 / 10	45	590	23	--	mg/L
	Nitrate	9 / 9	0.33	0.9	--	1.3	mg/L
	Sulfate	10 / 10	100	300	65	--	mg/L
HWGW101	Nitrate	13 / 13	1.7	2.2	1.5	--	mg/L
	Sulfate	14 / 14	88	190	84	--	mg/L

The new high and low detections shown above were only slightly above or below previous data and are not considered significant. ORP, pH, and temperature measurements were collected during low flow sampling beginning in the First Quarter 2006 and the First and Second Quarter 2006 results summarized in Table A-4-2.

4.3 Dissolved Metals Results

Groundwater samples collected from the five Battery Howe/Wagner monitoring wells were analyzed for three dissolved metals (aluminum, chromium and iron) during the First Quarter 2006 and 22 dissolved metals during the Second Quarter 2006. The current and historical dissolved metals results are shown on Table A-4-3.

Hexavalent chromium analysis was replaced by dissolved aluminum, chromium and iron analyses beginning with the Second Quarter 2003. Chromium primarily exists in three valence states in nature; chromium(0), trivalent chromium, and hexavalent chromium. Hexavalent

chromium is vastly more soluble than chromium(0) and trivalent chromium and therefore, the majority of dissolved chromium in groundwater likely consists of hexavalent chromium. During the First and Second Quarters 2006, dissolved chromium was detected in the well samples analyzed except for BHWGW04 and BHWGW05. Dissolved chromium was detected at concentrations of 24 and 22 µg/L within monitoring wells HWGW100 and HWGW101, respectively. These concentrations are within the historical concentration range for chromium previously detected within these wells.

Dissolved aluminum and iron were not detected above laboratory detection limits within the Battery Howe-Wagner monitoring wells sampled during the First and Second Quarters 2006 (Table A-4-3). Based on historical groundwater results at the Presidio, the presence of aluminum in groundwater samples is indicative of sample filter breakthrough. Aluminum and iron were included in the suite of analyses as indicators of potential filter failure. Additionally, dissolved iron, occurring in the divalent state, is a known reductant of hexavalent chromium. Hexavalent chromium would not be expected to be present with high dissolved iron concentrations.

During the First and Second Quarters 2006, dissolved arsenic, barium, copper, manganese and nickel were detected in select well samples (Table A-4-3). In addition, calcium, magnesium, potassium and sodium were detected in most wells. Arsenic was detected in one well HWGW100 at a concentration of 7.8 µg/L and was previously detected once in 1995 at well BHWGW01 (at 7 µg/L). Barium was detected in three of the five wells at concentrations ranging from 37 to 90 µg/L. Copper was detected in wells HWGW100 and BHWGW01 at concentrations of 1.4 and 2.3 µg/L. Manganese was detected at a new high in well BHWGW05 at a concentration of 560 µg/L and nickel was detected in wells BHWGW01 and BHWGW05 at concentrations of 3.5 and 31 µg/L, respectively. Dissolved metals results for the First and Second Quarters 2006 at Battery Howe/Wagner wells were near or within historical ranges and are not considered significant.

4.4 VOC Results

During the First Quarter 2006, samples were collected from the five Battery Howe/Wagner monitoring wells and analyzed for VOCs. Monitoring wells BHWGW01 and HWGW100 were the only wells with detected concentrations of VOCs. Monitoring well BHWGW01 had concentrations of carbon tetrachloride (1.1 µg/L) and chloroform (0.7 µg/L) detected within historical ranges. 1,1-DCE was detected during the First Quarter 2006 within monitoring well HWGW100 at a new high concentration of 3.0 µg/L (Table A-4-2). The detected concentration is only slightly higher than the previous high concentration and is not considered significant. No other VOCs were detected within the Battery Howe-Wagner monitoring wells during this quarter.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions during First and Second Quarters 2006 are consistent with historical values and interpretations. The five Battery Howe/Wagner monitoring wells were sampled and analyzed during the First and Second Quarter 2006 without any significant findings. The majority of dissolved metals and general chemistry results were within the range of previously detected concentrations for Battery Howe/Wagner monitoring wells and are not considered significant.

The VOCs results for the First Quarter 2006 are similar to historical trends with low levels of tetrachloride and chloroform detected in monitoring well BHWGW01 and 1,1-DCE detected in monitoring well HWGW100. In general, the majority of compound concentrations detected were within historical ranges. Analytes that were outside of historical bounds can generally be attributed to natural fluctuations.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO_3 concentrations (nitrate-NO_3) which are 4.43 times higher than nitrate-N concentrations.
mg/L - milligrams per liter
NA - not analyzed
NM - not measured
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
Table 7 in the main report identifies all duplicate and split samples and associate them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
mV - millivolts
ºC - degrees centigrade
ORP - Oxidation-reduction potential

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter
NA - not analyzed
ND - not detected
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
Table 7 in the main report identifies all duplicate and split samples and associate them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during pre quarterly reports.
µg/L - micrograms per liter
NA - not analyzed
ND - not detected
VOC - volatile organic compound
1,1-DCE - 1,1-dichloroethene
MTBE - methyl tert-butyl ether
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
Table 7 in the main report identifies all duplicate and split samples and associate them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

BUILDING 1349 STUDY AREA
APPENDIX SECTION A-5
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 1349 Study Area is located in the western portion of the Presidio (Figure 1). Building 1349 is east of Washington Boulevard, west of Harrison Boulevard, and south of Kobbe Avenue (Figure A-5-1). The Building 1349 Area is approximately 310 to 320 feet above the PLLW datum.

Building 1349 was a 100,000-gallon steel aboveground storage tank (AST) built in the 1950s and used in the base-wide fuel distribution system (FDS). The Building 1349 location (Figure A-5-1) was previously occupied by an AST of similar volume, which was built in 1906. A network of pipelines distributed the fuel to various areas throughout the Presidio. Use of the FDS was stopped in the early 1960s and the pipelines were left in place. The Army began an FDS pipeline removal and abandonment project in 1996, which removed most of the FDS pipelines. After the FDS was taken out of service, the AST associated with the FDS was used to store diesel fuel, which was off-loaded to tanker trucks for transportation to various locations in the Presidio (Montgomery Watson, 1996c). The International Technology Corporation (IT) removed Building 1349 in 1996. The Building 1349 monitoring wells are associated with former fueling operations at the Building 1349 Area.

Since the Second Quarter 2001, existing Building 1349 wells have been sampled and analyzed for general chemistry parameters, TPH, VOCs, OCPs, PCBs, PAHs, TDS, chlorinated herbicides, and/or dissolved metals. Summaries of the analytical results are presented in Tables A-5-1 through A-5-7.

The *Final Corrective Action Plan, Building 1349 Study Area, Presidio of San Francisco* (CAP) (BBL, 2006) was submitted to the stakeholders in February 2006. Groundwater sampling at the Building 1349 Area will be conducted in accordance with the CAP following the CAP's implementation. The recommended corrective actions for the Building 1349 Area are discussed in Section 3.0. Cleanup levels proposed in the CAP are presented in Tables A-5-2 through A-5-7 and in Table 3-2 from the CAP.

2.0 SITE DESCRIPTION AND GEOLOGY

The Building 1349 Area is located on a topographic high point on the boundary of the Marina Groundwater Basin and the Coastal Bluffs Groundwater Basin (Figures 1 and A-5-1). Surface

and groundwater flow directions vary across the Building 1349 site. Building 1349 monitoring wells 1394MW103, 1349MW104 and 1349MW105 are located within the Marina Groundwater Basin. The six remaining Building 1349 wells are located within the Coastal Groundwater Basin.

Since the Second Quarter 2001, groundwater depths beneath the site in wells located in the Coastal Groundwater Basin have ranged from approximately 23 to 38 feet bgs. Groundwater flow direction at Building 1349 follows the general topographic trend. Previous groundwater elevation measurements indicate that groundwater beneath the western part of the site consistently flows to the west and southwest towards Fill Site 5 (FS 5) within the Coastal Groundwater Basin (Table A-5-8). Groundwater elevation measurements from wells 1349MW103, 1349MW104, and 1349MW105 indicate that groundwater in this area generally flows in a northeasterly direction within the Marina Groundwater Basin (Table A-5-8) though a northwesterly flow direction was present in the Fourth Quarter 2003 and Third and Fourth Quarters 2004.

Soil units beneath most of the Building 1349 Area consist of Quaternary slope debris and ravine fill. Siltstone, sandstone, shale, and serpentinite of the Franciscan Formation underlie the Quaternary deposits. The slope debris and ravine fill layer is highly variable, consisting of differing combinations and percentages of silts, clays, sands, and gravels and varying in thickness from less than 5 to over 25 feet.

A high-resolution seismic reflection study was previously conducted by Montgomery Watson at the study area (Montgomery Watson, 1996b). The purpose of the study was to assess the depth to bedrock and whether seismic faults and fractures at the site could affect subsurface migration of contaminants. The study identified eight bedrock lineaments or weak zones that transect the site. Treadwell and Rollo conducted a two phase Site Investigation (SI) in 2002 and 2003. Based on the field observations from the first phase of the SI (Phase I SI) and previous boring logs, the underlying bedrock is highly fractured and weathered with varying degrees of hardness. In many of the fracture zones, particularly in the serpentinite units, clay and silt fault gouge with clasts or fragments of more competent rock were observed. Due to the lateral discontinuity and the varying elevations at which they were observed in the soil borings the extent of these bedrock fractures appears to be limited (Treadwell & Rollo, 2003d). The lineaments and an interred fault from the Montgomery Watson study are shown on Figure 4 of the *Draft Site Investigation Report* (SI), *Building 1349 Study Area, Presidio of San Francisco, California*, which was submitted to stakeholders in October 2003 (Treadwell & Rollo, 2003d).

Soil borings advanced during the Phase I SI generally encountered wet soil samples in the bedrock at depths ranging from approximately 30 to 40 feet bgs. After leaving the borings open for at most 48 hours, water levels were measured at depths ranging from 29 to 43 feet bgs, depending on the boring location. In several of the Phase I SI borings drilled to 40 feet bgs and into the bedrock, groundwater was not present or only a few inches of water had accumulated in the borings after approximately 48 hours. Based on these findings, groundwater appears to be

present only in particular locations within bedrock fractures and its occurrence is laterally discontinuous across the site. Groundwater movement likely follows the fractures within the bedrock and flows downslope following surface topography (Treadwell & Rollo, 2003d).

3.0 BUILDING 1349 STUDY AREA CAP

The Final Building 1349 Study Area CAP was submitted to the stakeholders in February 2006 (BBL, 2006). Groundwater sampling at the Building 1349 Area will be conducted in accordance with the CAP following its implementation. The CAP identifies four remedial units (RUs); shallow soil RU, deep soil RU, telecommunications conduit RU and the groundwater RU. The preferred alternative for each of the three soil RUs was excavation and offsite disposal. The preferred alternative for the groundwater RU was selected to be groundwater monitoring. The CAP is scheduled to be implemented in 2007. CAP cleanup levels are presented in Tables A-5-2 through A-5-7 and in Table 3-2 from the CAP.

4.0 GROUNDWATER MONITORING

Building 1349 currently has nine associated monitoring wells (Figure A-5-1). Groundwater elevations were collected at all nine Building 1349 monitoring wells during the First and Second Quarters 2006, as proposed.

All nine Building 1349 monitoring wells were purged and sampled during the First Quarter 2006. Monitoring well 1349MW100 was the only well proposed for sampling during the Second Quarter 2006, and therefore, it was the only well sampled.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006. Groundwater elevations are presented in Table A-5-8. Groundwater elevations of nearby FS 5 wells can be found in Table A-9-8. Water level meters were calibrated on 6 March and 22 May 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

To provide a broader understanding of groundwater gradients and flow directions in the Building 1349 Area, FS 5 and Baker Beach Disturbed Area 3 groundwater elevations were evaluated with Building 1349 Area groundwater elevations. The groundwater elevations measured during the First and Second Quarters 2006 within Building 1349 monitoring wells were slightly or significantly higher than elevations measured at the site during the First and Second Quarters 2005, with the exception of the groundwater elevations measured during the First Quarter 2006 within 1349MW101, which was slightly lower. The higher groundwater levels are likely due to the higher than normal precipitation in late 2005 and early 2006. Groundwater elevation maps

showing the First and Second Quarters 2006 groundwater contours and flow direction for the Building 1349/Fill Site 5 Area are included as Figures A-5-1 and A-5-2, respectively.

First Quarter 2006 groundwater elevations ranged from 277.19 to 287.04 feet above PLLW in Building 1349 Area monitoring wells 1349MW01 and 1349MW101, respectively (Figure A-5-1). Second Quarter 2006 groundwater elevations ranged from 278.90 to 292.12 feet above PLLW in Building 1349 Area monitoring wells 1349MW01 and 1349MW101, respectively (Figure A-5-2).

Building 1349 Area groundwater was observed to flow in three distinct directions during the First and Second Quarters 2006 dependent on which side of the groundwater basin boundary the wells are located. Groundwater in the Coastal Bluffs Groundwater Basin (wells 1349MW03R, and 1349MW100 through 1349MW102) was observed to flow southwesterly while groundwater in the Marina Groundwater Basin (wells 1349MW01, 1349MW103 through 1349MW105) was measured to flow northeasterly during the First Quarter 2006 and southeasterly during the Second Quarter 2006 (Figure A-5-2). Groundwater flow directions follow the local topography.

Groundwater flow in the area of monitoring wells 1349MW103 through 1349MW105 (Marina Groundwater Basin) has generally been to the northeast, as it was during the First Quarter 2006. However, during the Fourth Quarter 2003 and during the Third and Fourth Quarters 2004, groundwater flow in this area was to the northwest. During the Second Quarter 2006, groundwater flow in this area was to the southeast.

During the First and Second Quarters 2006, the groundwater gradient was calculated to be approximately 0.06 and 0.09 feet per foot, respectively. Groundwater gradient in the vicinity of monitoring wells 1349MW103 through 1349MW105 was calculated to be approximately 0.013 and 0.04 feet per foot during the First and Second Quarters, respectively. Groundwater flow directions and gradients are consistent with the majority of previously calculated flow directions and gradients at the site. However, as mentioned above, flow direction in the area of monitoring wells 1349MW103 through 1349MW105 has also been observed to be to the northwest on three past occasions, and to the southeast during Second Quarter 2006.

4.2 Monitoring Well Purging and Sampling

All nine Building 1349 Area monitoring wells scheduled for sampling during the First Quarter 2006 were purged and sampled between 7 and 20 March 2006. Monitoring well 1349MW100 was the only well proposed for sampling during the Second Quarter 2006 and was purged and sampled on 24 May 2006. All Building 1349 Area monitoring wells were purged and sampled using methods shown in Tables 1A and 1B, and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, volumes, and general chemistry parameters for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon aboveground polyethylene storage tank located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are described in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed for the First and Second Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

All groundwater samples collected from Building 1349 Area monitoring wells during the First Quarter 2006 were analyzed for general chemistry parameters, TDS, OCPs, VOCs, PAHs, TPHg, TPHd, TPHfo, and 23 dissolved metals. In addition, monitoring wells 1349MW02, 1349MW03R, 1349MW100, 1349MW101, and 1349MW102 were analyzed for PCBs (Table 1A).

Groundwater samples collected from Building 1349 Area monitoring well 1349MW100 during the Second Quarter 2006 were analyzed for general chemistry parameters, TDS, OCPs, VOCs, PAHs, TPHg, TPHd, TPHfo, and 23 dissolved metals (Table 1B).

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C_{24} to C_{36}. Section 5.4.3.1 in the main report discusses the data compatibility issues associated with TPH analyses.

Potential contaminants of concern and their associated cleanup levels are listed in the CAP (BBL, 2006). Applicable cleanup levels are also listed in Tables A-5-1 through A-5-7, which present groundwater analytical results. First and Second Quarter 2006 detected groundwater analytical results are summarized below and compared to the cleanup levels where applicable.

As part of the low flow sampling methods and as recommended in the *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Sites, Presidio of San Francisco* (MACTEC, 2006), ORP, pH, and temperature were measured and data are summarized in Table A-5-1.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-5-1. During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.08 mg/L in monitoring well 1349MW104 to 1.11 mg/L in monitoring well 1349MW101.

During the Second Quarter 2006, the dissolved oxygen concentration within well 1349MW100 was 1.1 mg/L. Dissolved oxygen was measured at new low concentrations within 1349MW102 and 1349MW104 during the First Quarter 2006. The new low concentration within 1349MW102 was not significantly different than the previous low and can be attributed to natural fluctuations. The new low concentration within 1349MW104 (0.08 mg/L) is significantly lower than the previous low concentration of 0.32 mg/L.

5.2 General Chemistry Results

General chemistry results are presented in Table A-5-1. General chemistry results for the First and Second Quarters 2006 within the Building 1349 Area are generally within historical ranges. The table below summarizes new high and low general chemistry analytical results when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the number of sampling events, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
1349MW01	Sulfate	24 / 24	161	262 *	--	300	mg/L
1349MW03R	Alkalinity, Total	11 / 11	330	390	--	440	mg/L
	Bicarbonate	11 / 11	330	390	--	440	mg/L
1349MW100	Chloride	16 / 16	810	1,500	760	--	mg/L
	Sulfate	12 / 16	< 0.5	37	--	65	mg/L
1349MW101	Chloride	10 / 10	190	300	180	--	mg/L
1349MW102	N as Nitrite	1 / 23	< 0.05	< 0.1	--	0.025	mg/L
	Sulfate	23 / 23	18 *	95	--	156	mg/L
1349MW103	Alkalinity, Total	7 / 7	310	600	--	670	mg/L
	Bicarbonate	7 / 7	310	600	--	670	mg/L
	Chloride	7 / 7	790	830	--	930	mg/L
	Fluoride	7 / 7	0.31	0.66	0.29	--	mg/L
1349MW104	Sulfate	6 / 6	55	67	--	74	mg/L
1349MW105	Alkalinity, Total	6 / 6	230	280	--	300	mg/L
	Bicarbonate	6 / 6	230	280	--	300	mg/L
	Chloride	6 / 6	540	760	450	--	mg/L
	Fluoride	6 / 6	0.33	0.63	0.29	--	mg/L
	Sulfate	6 / 6	130	150	76	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the general chemistry parameters measured during the First and Second Quarters 2006 are within historical ranges. Significant new high and low general chemistry results are discussed below.

- Nitrite was detected at a new high concentration of 0.025 mg/L in the QC duplicate sample collected from 1349MW102 during the First Quarter 2006. This is the first time nitrite has been detected within this well. Nitrite was not detected within either the primary or the duplicate samples collected from this well; however, the reporting limit was 0.05 mg/L.

General chemistry parameters within Building 1349 Area monitoring wells have remained relatively stable. The concentration fluctuations of general chemistry parameters within Building 1349 Area monitoring wells can likely be attributed to natural concentration fluctuations, and are not considered to be significant.

5.3 TPH Results

Results of TPH analyses are presented in Table A-5-2 and on Figure A-5-3. All TPH analyses were performed in accordance with Tables 1A and 1B. The table below summarizes new high and low TPH results when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Total Petroleum Hydrocarbons							
1349MW102	TPH As Diesel C12-C24	3 / 22	< 50	54	--	60 *	µg/L
1349MW01	TPH As Diesel C12-C24	2 / 29	< 50	57 *	--	79 *	µg/L
1349MW103	TPH As Diesel C12-C24	1 / 7	< 50	< 50	--	54 *	µg/L
1349MW104	TPH As Diesel C12-C24	1 / 6	< 50	< 50	--	55 *	µg/L

Qualified data in the table above is indicated with an asterisk (*).

TPHg was detected within 1349MW100 at a concentration of 1,300 µg/L during the First Quarter 2006. The detected concentration within 1349MW100 during the First Quarter 2006 exceeds the CAP-specified cleanup level of 770 µg/L.

During the First Quarter 2006, TPHd was detected at new high concentrations of 79, 54, and 55 µg/L within monitoring wells 1349MW01, 1349MW103, and 1349MW104, respectively. TPHd was also detected in the QC duplicate sample in monitoring well 1349MW102 at a concentration of 60 µg/L. These detections are well below the Building 1349 Area CAP-specified cleanup level of 880 µg/L. TPHd was detected at a concentration of 6,900 µg/L in monitoring well 1349MW100, which exceeds the CAP-specified cleanup level.

During the Second Quarter 2006, TPHg was detected in the primary, duplicate and QC samples from 1349MW100 at concentrations of 690, 490, and 350 µg/L, respectively. TPHd was detected in the primary, duplicate and QC samples from 1349MW100 at concentrations of 3,600, 5,200, and 5,400, respectively. TPHfo was not detected within 1349MW100 during either the First or Second Quarters 2006.

TPH concentrations at the site have generally been non-detect with the exception of TPHg and TPHd concentrations in 1349MW100. TPHd concentrations within 1349MW100 continue to fluctuate, typically in excess of their applicable cleanup levels. The potential for increasing or decreasing TPH concentration trends at the site will continue to be evaluated in future monitoring events.

5.4 OCP and PCB Results

OCP and PCB results are presented in Table A-5-4. Beta-BHC and gamma-BHC results are also shown on Figure A-5-3. The table below summarizes new high and low OCP results when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the number of sampling events, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Pesticides/PCBs							
1349MW100	alpha-Chlordane	9 / 16	< 0.049	0.3 *	--	0.9 *	µg/L
	gamma-Chlordane	7 / 16	< 0.049	0.4 *	--	0.7 *	µg/L
	Heptachlor Epoxide	8 / 14	< 0.05	0.2 *	--	0.4	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Several OCP compounds were detected within upgradient monitoring well 1349MW100 during the First and Second Quarters 2006.

During the First Quarter 2006, alpha-chlordane and gamma chlordane were detected at new high concentrations of 0.9 and 0.7 µg/L, respectively. 4,4'-DDD (0.9 µg/L), aldrin (0.3 µg/L), delta-BHC (0.1 µg/L), dieldrin (0.4 µg/L), heptachlor (0.8 µg/L), and heptachlor epoxide (0.2 µg/L) were detected within the historical concentration ranges for these compounds.

During the Second Quarter 2006, heptachlor epoxide was detected in the primary sample at a new high concentration of 0.4 µg/L and in the duplicate sample at a concentration of 0.3 µg/L. 4,4'-DDT was detected in the primary and duplicate samples at a concentration of 0.8 µg/L. Aldrin and alpha-chlordane were detected in the duplicate samples at concentrations of 0.3 and 0.8 µg/L, respectively.

Some of these detected concentrations exceeded both the concentrations of OCPs previously detected in 1349MW100, and the applicable cleanup levels as outlined in the CAP (BBL, 2006).

OCPs have been detected in the past in monitoring wells 1349MW03R, 1349MW101, and 1349MW102, which are generally downgradient of monitoring well 1349MW100. However, OCPs have not been detected within any of these wells for five sampling events.

OCPs have been retained as contaminants of concern at the Building 1349 Area to evaluate potential corrective actions. Former Building 1349 operations involved fuel storage and distribution. The source of OCP concentrations at the Building 1349 Area is not currently known.

PCBs have not been detected within any Building 1349 Area monitoring wells to date.

5.5 Chlorinated Herbicides

Chlorinated herbicides were removed from the Building 1349 Area due to a lack of significant detections, and were not proposed for sampling and analysis during the First and Second Quarters 2006.

5.6 PAHs

PAH analysis was completed for all Building 1349 monitoring wells during the First Quarter 2006. Monitoring well 1349MW100 was the only sample analyzed for PAHs during the Second Quarter 2006.

Several PAH compounds were detected within monitoring well 1349MW100 during the First and Second Quarters 2006.

During the First Quarter 2006, acenaphthene (6.6 µg/L), anthracene (0.36 µg/L), benzo(a) anthracene (0.35 µg/L), chrysene (0.29 µg/L), fluoranthene (2.3 µg/L), fluorene (10 µg/L), phenanthrene (9 µg/L), and pyrene (0.75 µg/L) were detected at concentrations within the range of historical concentrations for these compounds at this well. During the Second Quarter 2006 in the primary, duplicate and QC samples, acenaphthene was detected at concentrations of 3.6, 4.3, and 5.6 µg/L, respectively. Anthracene was detected at concentrations of 0.2, 0.28, and 0.24 µg/L, respectively. Benzo(a) anthracene was detected at concentrations of 0.11, 0.14, and 0.48 µg/L, respectively. Chrysene was detected in the duplicate sample only at a concentration of 0.1 µg/L. Fluoranthene was detected at concentrations of 1.6, 1.8, and 0.38 µg/L, respectively. Fluorene was detected at concentrations of 7.5, 8.4, and 4.0 µg/L, phenanthrene was detected at concentrations of 4.9, 5.8, and 3.5 µg/L, respectively, and pyrene was detected at concentrations of 0.38, 0.48, and 0.44 µg/L. These detected concentrations were within the range of historical concentrations within this well. No other PAHs were detected in any of the Building 1349 Area samples during the First or Second Quarters 2006.

The concentrations of benzo(a)anthracene in the First and Second Quarters 2006, exceeded the Building 1349 Area CAP-specified cleanup level of 0.1 µg/L. These detected concentrations were within the range of historical concentrations within this well.

PAH concentrations continue to fluctuate within monitoring well 1349MW100 with 8 to 10 PAHs typically present in recent sampling events. The potential for increasing or decreasing PAH concentration trends at monitoring well 1349MW100 will continue to be evaluated in future monitoring events.

5.7 VOC Results

VOCs were only detected in the samples from 1349MW100 during the First and Second Quarters 2006. Several Building 1349 Area wells were sampled during the First Quarter 2006 but monitoring well 1349MW100 was the only well sampled during the Second Quarter 2006. VOC results are summarized in Table A-5-3.

Benzene was detected within monitoring well 1349MW100 during the First Quarter 2006 at a concentration of 22 µg/L, and in the Second Quarter 2006 primary, duplicate, and QC samples at concentrations of 29, 28, and 30 µg/L, respectively. These concentrations exceed the Building 1349 Area cleanup level for benzene of 1 µg/L.

Carbon disulfide was not detected within monitoring well 1349MW100 during the First Quarter 2006, but was detected in the primary and duplicate samples from monitoring well 1349MW100 during the Second Quarter 2006 at concentrations of 0.7 and 0.8 µg/L, respectively. This is the first detection of carbon disulfide since Second Quarter 2003. Ethylbenzene and total xylenes were both detected within monitoring well 1349MW100 during the First Quarter 2006 at a concentration of 0.8 µg/L.

Ethylbenzene was detected within monitoring well 1349MW100 during the Second Quarter 2006 in the primary and duplicate samples at a concentration of 0.8 µg/L, and in the QC duplicate sample at a concentration 0.9 µg/L. Total xylenes were detected within monitoring well 1349MW100 during the Second Quarter 2006 at concentrations of 3.8, 3.7, and 4.2 µg/L in the primary, duplicate, and QC duplicate samples, respectively. The detected concentrations of ethylbenzene and total xylenes are well below their respective cleanup levels.

5.8 Dissolved Metals Results

Dissolved metals results are presented in Table A-5-7 and arsenic, chromium, and iron results are illustrated in Figure A-5-3. The following table summarizes new high and low dissolved metal results for the First and Second Quarters 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the number of sampling events, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
1349MW01	Barium	17 / 17	34	620	32	--	µg/L
1349MW02	Cadmium	1 / 22	< 1	< 1	--	1.1	µg/L
1349MW03R	Total Dissolved Solids	12 / 12	360	1,980	--	2,060	mg/L
1349MW100	Magnesium	14 / 14	190,000	390,000	180,000 *	--	µg/L
	Selenium	1 / 14	< 5	< 5	--	10	µg/L
	Total Dissolved Solids	16 / 16	1,820	5,570	510	--	mg/L
1349MW101	Calcium	10 / 10	16,000	36,000	15,000	--	µg/L
	Potassium	10 / 10	2,200	9,800	1,700 *	--	µg/L
1349MW102	Aluminum	1 / 18	< 100	< 100	--	260	µg/L
	Arsenic	2 / 18	< 5	7.3	< 2 *	--	µg/L
	Cobalt	1 / 18	< 7	1.4	< 1 *	--	µg/L
	Selenium	1 / 16	< 5	< 5	--	2.3	µg/L
1349MW103	Barium	4 / 7	< 10	21	--	26 *	µg/L
	Magnesium	7 / 7	190,000	320,000	--	330,000	µg/L
	Potassium	7 / 7	5,600	13,000	5,400 *	--	µg/L
	Total Dissolved Solids	7 / 7	1,320	1,650	--	2,220	mg/L
1349MW104	Barium	6 / 6	35	78	--	100 *	µg/L
	Iron	6 / 6	190	410	180 *	--	µg/L
1349MW105	Antimony	6 / 6	1.5	4.5	1.4	--	µg/L
	Calcium	6 / 6	71,000	86,000	56,000	--	µg/L
	Iron	6 / 6	360	600	130	--	µg/L
	Magnesium	6 / 6	150,000	180,000	140,000	--	µg/L
	Sodium	6 / 6	120,000	200,000	110,000	--	µg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the dissolved metal concentrations detected during the First and Second Quarters 2006 are within historical ranges. Significant new high and low dissolved metals results are discussed below.

- During the First Quarter 2006, dissolved aluminum was detected in the duplicate sample from monitoring well 1349MW102 at a concentration of 260 µg/L. Aluminum has not been detected within this well in previous sampling events. Dissolved aluminum detections can be indicative of filter breakthrough; however, the majority of the other metals detected within the duplicate sample, with the exception of dissolved iron, were within the range of previously detected metals concentrations within this well. Dissolved iron was detected within the duplicate sample at a concentration more than double the concentrations reported within the primary and the QC duplicate samples within this well.

- Dissolved cadmium was detected just above the laboratory reporting limit at a concentration of 1.1 µg/L within monitoring well 1349MW02 during First Quarter 2006. Cadmium has not previously been detected within this well. Additionally, dissolved iron was detected within this sample at a concentration higher than typically observed within this well. The presence of elevated concentrations of dissolved aluminum and iron typically are indicative of a filtering issue, however, the majority of the remaining metals are within historical ranges.
- Dissolved chromium was detected during the First Quarter 2006 at concentrations of 75 and 120 µg/L, in monitoring wells 1349MW02 and 1349MW03R, respectively. Chromium concentrations within 1349MW02 have exceeded the Building 1349 Area CAP-specified cleanup level of 50 µg/L since the Second Quarter 2001, and within 1349MW03R since the First Quarter 2004. Chromium is thought to be naturally occurring and a result of these wells being screened in serpentinite bedrock.
- Dissolved iron was detected at a new low concentration of 130 µg/L within monitoring well 1349MW105 during the First Quarter 2006. This concentration was approximately three times lower than the previous low concentration at this well.
- Dissolved selenium was detected at a concentration of 2.3 µg/L in the QC duplicate sample from monitoring well 1349MW102 and at a concentration of 10 µg/L in monitoring well 1349MW100, during First Quarter 2006. Selenium has not been detected within either of these wells in previous sampling events.

The remaining new low and high concentrations of dissolved metals likely represent natural fluctuations and are not considered significant. The potential for increasing or decreasing concentration trends will be evaluated in future quarterly monitoring events.

6.0 CONCLUSIONS & RECOMMENDATIONS

Nine Building 1349 monitoring wells were sampled during the First Quarter 2006. Monitoring well 1349MW100 was the only well sampled during the Second Quarter 2006.

The Building 1349 Area CAP was finalized and submitted to the stakeholders in February 2006. Groundwater sampling at the Building 1349 Area will be conducted in accordance with the CAP when the CAP is implemented. The recommended corrective actions for the Building 1349 Area are detailed in the CAP and are summarized in Section 3.0.

TPHg was detected above its Building 1349 Area CAP cleanup level during the First Quarter 2006 at 1349MW100. TPHd was also detected within this well above its Building 1349 Area CAP cleanup level during both the First and Second Quarters 2006. TPHd concentrations continue to exceed groundwater cleanup levels within monitoring well 1349MW100, and both TPHg and TPHd continue to fluctuate significantly from one sampling event to the next at this location.

OCPs continue to be detected within monitoring well 1349MW100. During the First Quarter 2006, alpha-chlordane and gamma chlordane were detected at new high concentrations. Additional detections included 4,4'-DDD, aldrin, delta-BHC, dieldrin, heptachlor, and heptachlor epoxide, which were detected within the historical concentration ranges for these compounds at this well. During the Second Quarter 2006, heptachlor epoxide was detected at a new high concentration, and 4,4'-DDT, aldrin and alpha-chlordane were also detected. Some of these detected concentrations exceeded both the concentrations of OCPs previously detected in 1349MW100, and the applicable cleanup levels as outlined in the CAP (BBL, 2006). OCPs have been detected in the past in monitoring wells 1349MW03R, 1349MW101, and 1349MW102, which are generally downgradient of monitoring well 1349MW100. However, OCPs have not been detected within any of these wells for at least five sampling events.

Dissolved arsenic, iron, and manganese have been detected in monitoring well 1349MW100 samples at concentrations generally higher than within the other Building 1349 monitoring wells. Arsenic is commonly found in the natural environment and is often present in combination with iron and manganese oxides. Arsenic has also been detected at elevated concentrations in monitoring well 1349MW105, although not in association with elevated concentrations of manganese or iron.

Arsenic, iron and manganese are generally more soluble and mobile under reducing conditions. A reducing environment likely exists within 1349MW100 due to the degradation of petroleum hydrocarbons present at this well. This chemical process is likely contributing to the elevated levels of dissolved arsenic, iron and manganese within 1349MW100. Future detections and concentration trends of these compounds will continue to be monitored and evaluated.

Building 1349 Area monitoring wells will continue to be sampled in accordance with the Building 1349 Area CAP, and results evaluated against the Building 1349 Area CAP cleanup levels.

Notes
µg/L - micrograms per liter
--- = Cleanup level is not available.
QAPP - Quality Assurance Project Plan
TPHd - total petroleum hydrocarbons as diesel
TPHg - total petroleum hydrocarbons as gasoline
TPHfo - total petroleum hydrocarbons as fuel oil
a - Development of Presidio-wide Cleanup Levels for Soil, Sediment, Groundwater and Surface Water, Presidio of San Francisco (EKI, 2002), Table 7-6, Cleanup Levels for Surface Water, Seeps, and Groundwater at the Presidio of San Francisco (Drinking Water Cleanup Level) or maximum contaminant levels (MCLs), if available.
b - These values also apply to TPH as motor oil.
c - Values are Environmental Screening Levels (ESLs) for drinking water (RWQCB, 2003b).
d - Drinking water level is lower than laboratory reporting limit. Therefore, laboratory reporting limit is selected as achievable cleanup level.
e - Cleanup level for chlordane is applied to both alpha and gamma isomers. Both isomers are reported in laboratory data.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly report.
2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO_3 concentrations (nitrate-NO_3) which are 4.43 times higher than nitrate-N concentrations. Section 6.2.1.2 in the main report discusses this issue.
mg/L - milligrams per liter
mV - millivolts
NA - Not analyzed
NM - Not measured
NR - Not reported
ORP - oxidation reduction potential
^{o}C - degrees centigrade
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Draft Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2005).
3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain-of-custody.
Concentrations in **bold** indicate an exceedance of applicable cleanup levels (BBL, 2005).
µg/L - micrograms per liter
NA - Not analyzed
TPH - Total petroleum hydrocarbons
Y - Sample exhibits fuel pattern that does not resemble the standard.
CL suffix denotes a quality control duplicate sample was sent to control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the Draft Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California (BBL, 2005).
Concentrations in **bold** indicate an exceedance of applicable cleanup levels.
"--" cleanup level not established
µg/L - micrograms per liter
ND - Not detected
NA - Not analyzed
NS - Not sampled
VOC - Volatile organic compound
MTBE - Methyl tert-butyl ether
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Draft Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California* (BBL, 2005).
Bold numbers indicate detected concentrations which exceed drinking water quality criteria.
µg/L - micrograms per liter
-- cleanup level not established
ND - Not detected
NA - Not analyzed
- The continuing calibration verification (CCV) drifted outside the limits although the average CCV drift was within method requirements.
OCPs - Organochlorine pesticides
PCBs - Polychlorinated biphenyls
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the Draft Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California (BBL, 2005).
BOLD concentrations indicate an exceedance of applicable cleanup levels.
-- cleanup level not established
µg/L - micrograms per liter
ND - Not detected
NS - Not sampled
PAHs - Polycyclic aromatic hydrocarbons
CL suffix denotes a quality control duplicate sample was sent to control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Results of Army and Trust studies support the hypothesis that dissolved chromium and hexavalent chromium measured in groundwater in upland areas of the Presidio appear to be naturally occurring and derived from serpentinite.
Hexavalent chromium was not retained as a COC in the Draft CAP (BBL, 2005).
3 - Groundwater cleanup levels were taken from the Draft Corrective Action Plan Building 1349 Study Area, Presidio of San Francisco, California (BBL, 2005).
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
-- cleanup level not established
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

LEGEND

- 1349MW103 Groundwater Monitoring Well
- LF5GW101 Adjacent Study Area Well
- Former Fill Site 5 Excavation Boundary
- Inferred Fault
- Topographic Contour (Contour Interval : 5 ft)
- 1354 Building and Number

Notes:
Monitoring well 1349MW100 was the only well scheduled to be sampled during the Second Quarters 2006 in accordance with the proposed plan.

Groundwater concentration data in micrograms per liter (µg/L).

TPHd - Total Petroleum Hydrocarbons as Gasoline
TPHg - Total Petroleum Hydrocarbons as Diesel
CL - Quality Control Duplicate
DU - Blind Duplicate

AST - Above ground Storage Tank
UST - Underground Storage Tank

Refer to Table 11 for data qualifiers.

Location of inferred fault from Revised Feasibility Study Main Installation Sites (EKI, 2003).

Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet
Vertical Datum: (topography) North American Vertical Datum, NAVD88

BUILDING 1349

FILL SITE 1, LANDFILL 2, EL POLIN SPRING
TENNESSEE HOLLOW, AND UPGRADIENT WELLS
APPENDIX SECTION A-6
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells area monitoring wells are located in the southeastern portion of the Presidio (Figure 1). Fill Site 1 is north of the Julius Kahn Public Playground. The site vicinity includes the El Polin Spring picnic area and the El Polin Spring sampling location (Figure A-6-1). The elevation at Fill Site 1 ranges from approximately 100 to 150 feet above the PLLW datum (Montgomery Watson, 1996c). The elevation at Landfill 2 ranges from approximately 140 to 240 feet above the PLLW datum. The Tennessee Hollow and the Upgradient Wells area monitoring wells have surface elevations ranging from approximately 45 to 110 feet and 170 to 265 feet above the PLLW datum, respectively.

Debris fill materials were disposed in Fill Site 1 from 1948 until 1973. Landfill 2 was in operation from 1946 to 1973 and was used for disposal of building debris and other wastes (Dames and Moore, 1997; Ringden and Sitton, 1990). Potential sources of contamination exist in fill materials disposed at both Fill Site 1 and Landfill 2. The Upgradient Area and Tennessee Hollow wells are currently being used to monitor groundwater elevations only, and are not sampled.

Groundwater sampling began in November 1990 at Fill Site 1 and Landfill 2. Groundwater samples have been analyzed for some or all of the following: general chemistry parameters, VOCs, SVOCs, OCPs, PCBs, chlorinated herbicides, TPH, dissolved metals, and cyanide. No OCPs, PCBs or chlorinated herbicides have ever been detected in any of the monitoring wells currently being monitored at the site. A summary of historical groundwater analytical results can be found in Tables A-6-1 through A-6-4.

2.0 SITE DESCRIPTION AND GEOLOGY

Fill Site 1, Landfill 2, El Polin Spring, Tennessee Hollow, and Upgradient Wells Areas are located within the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Groundwater generally flows northward across the site towards the Crissy Field Groundwater Area (Montgomery Watson, 1996c).

Fill Site 1 and Landfill 2 have 10 associated monitoring wells (LF01GW01 through LF01GW07, and LF02GW01, LF02GW02, and LF02GW04) and one surface water sampling location (EPSP01) (Figure A-6-1). The Tennessee Hollow Area has four monitoring wells (TH-1, TH-2, TH-3, and TH-4), and the Upgradient Wells Area has five monitoring wells (UBR01GW01, UBR02GW01, UBR02GW02, UBR03GW01, and UBR03GW02). Three additional monitoring wells (10GW100, 300GW01 and PGFGW100) located near Building 10, the Presidio Golf Course, and Paul Goode Field are monitored for groundwater elevation on a quarterly basis. Two monitoring wells (100GW101 and 104GW100) were installed adjacent to Buildings 100 and 104 in October 2002. These two wells have had four consecutive quarters of non-detect sampling results and therefore were removed from the sampling schedule beginning with the Second Quarter 2004. Abandonment of these wells will be proposed in the Mini-CAP Group II document, which is currently being prepared.

The Northeastern Groundwater Area is covered with grasses, annual plants, and trees and is occupied by Presidio housing. Fill Site 1 and Landfill 2 are located in the Tennessee Hollow Valley. The Landfill 2 site is approximately 300 feet west of Fill Site 1 (Figure A-6-1). Landfill 2 is in a hilly, densely forested area. Fill Site 1 contains fill from the ground surface to approximately 34 feet bgs. The fill at Fill Site 1 consists of sand and gravel with varying amounts of construction debris. The fill layer at Landfill 2 extends from the ground surface to 20 feet bgs. The fill material found in Landfill 2 consists of glassware, hospital debris, wood, and general construction debris. The fill layer at both sites is underlain by laterally bedded, fine-grained, silty sand of the Colma Formation. Serpentinite rock of the Franciscan Formation lies beneath the Colma Formation and was encountered at depths ranging from 40 to 79 feet bgs (Montgomery Watson, 1996c). The five Upgradient wells (UBR01GW01, UBR02GW01, UBR02GW02, UBR03GW01, and UBR03GW02) are screened in Franciscan Formation bedrock.

3.0 GROUNDWATER MONITORING

During First and Second Quarter 2006, groundwater elevations were measured at all monitoring wells. Groundwater samples were collected from Fill Site 1, Landfill 2, and from the El Polin Spring during the First Quarter 2006. No monitoring wells or El Polin Spring were scheduled for sampling during the Second Quarter 2006.

3.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006 at all well locations. Groundwater elevations are summarized in Table A-6-5. Water level meters were calibrated on 6 March and 22 May 2006 and the calibration forms can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C. Although new high groundwater elevations were measured in several of the wells during the First and Second Quarters 2006, these high elevations are only slightly higher than previous measurements, likely due to higher than normal precipitation, and are generally consistent with historical observations.

The groundwater elevation within monitoring well 10GW100 was evaluated with Building 215 and nearby Commissary/PX Area monitoring wells during the First and Second Quarter 2006 and sufficient data now exists to calculate groundwater flow directions and gradients in the northern portion of the area. Groundwater elevation data associated with the Commissary/PX area can be found in Section A-16.

First Quarter 2006 groundwater elevations ranged from 33.39 to 244.59 feet above PLLW in monitoring wells 10GW100 and UBR02GW01, respectively. A First Quarter 2006 groundwater elevation map showing groundwater contours and flow directions for Fill Site 1, Landfill 2, Tennessee Hollow, and Upgradient Wells is included as Figure A-6-2. First Quarter 2006, groundwater was determined to flow in northeasterly, northerly, and northwesterly directions in the southern portion of the area, following the general topographic trend. The groundwater gradient was estimated to be approximately 0.12 feet per foot to the northeast, approximately 0.030 feet per foot to the north, and approximately 0.093 feet per foot to the northwest.

The groundwater flow direction and gradient in the northern portion of the area are depicted on Figure A-6-4. Groundwater flow was northerly during the First Quarter 2006 in the northern portion of the area, which follows the general topographic trend. The groundwater gradient was estimated to be approximately 0.015 feet per foot in this area.

Second Quarter 2006 groundwater elevations ranged from 33.39 feet above PLLW in monitoring well 10GW100 to 246.95 feet above PLLW in monitoring wells UBR02GW01 and UBR02GW02. A Second Quarter 2006 groundwater elevation map showing groundwater contours and flow directions for Fill Site 1, Landfill 2, Tennessee Hollow, and Upgradient Wells is included as Figure A-6-3. Second Quarter 2006, groundwater flow was in northeasterly, northerly, and northwesterly directions in the southern portion of the area, following the general topographic trend. The groundwater gradient was estimated to be approximately 0.109 feet per foot to the northeast, approximately 0.031 feet per foot to the north, and approximately 0.12 feet per foot to the northwest.

The Second Quarter 2006 groundwater flow direction and gradient in the northern portion of the area are depicted on Figure A-6-5. Groundwater was determined to flow northerly during the Second Quarter 2006 in the northern portion of the area, which follows the general topographic trend. The groundwater gradient was estimated to be approximately 0.012 feet per foot in this area.

Upgradient well UBR02GW01 is adjacent to and screened deeper than UBR02GW02, and upgradient well UBR03GW01 is adjacent to and screened deeper than UBR03GW02. Groundwater elevations in wells UBR02GW01 and UBR03GW01 have a different potentiometric surface than the adjacent wells that are screened shallower and were not used in constructing groundwater contours or calculating groundwater gradients in the shallow aquifer. The groundwater gradients and flow directions calculated during this sampling event are consistent with previous findings.

3.2 Monitoring Well Purging and Sampling

Groundwater samples were collected from all Fill Site 1 and Landfill 2 groundwater monitoring wells during the First Quarter 2006. A surface water sample, EPSP01, was collected from El Polin Spring during the First Quarter 2006. The samples were collected in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

In accordance with the proposed sampling schedules (Tables 1A and 1B), no Fill Site 1, Landfill 2 monitoring wells or El Polin Spring were sampled during the Second Quarter 2006.

Purge equipment, purging volumes, and sampling equipment for each monitoring well are described in the purge *records* located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

3.3 Groundwater Analytical Program

Groundwater and surface water samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used at each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the First and Second Quarters 2006.

4.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from the Fill Site 1 and Landfill 2 areas during the First Quarter 2006 were analyzed for general water chemistry parameters, TDS, cyanide, and 22 dissolved metals. The surface water sample collected from El Polin Spring was analyzed for general water chemistry parameters, TDS, cyanide, 22 total metals, and 22 dissolved metals during the First Quarter 2006. No additional samples were collected during the First and Second Quarters 2006, in accordance with the proposed sampling schedule (Tables 1A and 1B).

Groundwater data collected in October 2002 from monitoring wells 100GW101 and 104GW101 as part of the Mini-CAP investigation is reported in the *Draft Summary Additional Investigations, Mini-CAP Sites, January 2003*, prepared by Geo/Resource Consultants, and has been incorporated into Table A-6-2.

4.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-6-1. During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.4 mg/L in well LF02GW02 to 4.22 mg/L in monitoring well LF01GW07. A new low concentration of dissolved oxygen (0.71 mg/L) was measured within monitoring well LF01GW03, during the First Quarter 2006 (Table A-6-1). However, this new low concentration is not significantly different than previous concentrations and can be attributed to natural fluctuations.

During the First Quarter 2006, dissolved oxygen was measured in the El Polin Spring sample at a concentration of 7.05 mg/L which is within the historical concentration range.

4.2 General Chemistry Results

General chemistry results for the First Quarter 2006 at Fill Site 1, Landfill 2, and the El Polin Spring, are generally within historical ranges (Table A-6-1). The table below summarizes new high and low general chemistry analytical results for the First Quarter 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
LF01GW06	Chloride	31 / 31	2.2	335 *	1.5	--	mg/L
	Nitrate	17 / 17	0.34	12	0.16	--	mg/L
LF02GW04	Chloride	28 / 28	61	170	46	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

One Fill Site 1 sample and one Landfill 2 sample had new low chloride concentrations during the First Quarter 2006. LF1GW06 also had a new low nitrate concentration. However, these are attributed to natural fluctuations and are not considered to be significant. A summary of historical general chemistry results for these areas are presented in Table A-6-1.

4.3 Cyanide Results

Cyanide was detected at a laboratory reporting limit of 0.01 for the first time in the sample from monitoring well LF01GW02 collected during the First Quarter 2006. The detected concentration is not considered significant. Cyanide was previously detected on two occasions; at EPSP01 at 0.009 mg/L in 1994 and at LF01GW01 at 0.02 mg/L in 2002. Cyanide will continue to be monitored within Fill Site 1 and Landfill 2 monitoring wells and at El Polin Spring on an annual basis. A summary of cyanide results for these areas are presented in Table A-6-1.

4.4 SVOC, PAH, OCP, PCB, Chlorinated Herbicides, and VOC Results

No SVOCs, PAHs, OCPs, PCBs, chlorinated herbicides, or VOC analyses were performed for any of the Fill Site 1 or Landfill 2 monitoring well or El Polin Spring samples during the First and Second Quarters 2006. A summary of historical SVOC, PAHs, OCPs, PCBs, chlorinated herbicide, and VOC results for these areas are presented in Table A-6-2.

4.5 Dissolved Metals Results

Fill Site 1 and Landfill 2 groundwater samples and the El Polin Spring surface water samples collected during the First Quarter 2006 were analyzed for dissolved metals. A summary of dissolved metals results for these areas is presented in Table A-6-3. Beginning in the Second Quarter 2003, seven metals (arsenic, barium, beryllium, chromium, cobalt, nickel, and zinc), which were previously analyzed by EPA Method 6020, were granted variance from the QAPP reporting limits by the stakeholders and were analyzed using EPA Method 6010, as discussed in Section 5.1 of the main text. This change in analytical method has generally resulted in an expected slight increase in laboratory reporting limits for these metals.

Dissolved metals results for the First Quarter 2006 at Fill Site 1, Landfill 2, and El Polin Spring are generally within historical ranges. The table below summarizes new high and low dissolved metals analytical results for the First Quarter 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
LF01GW01	Magnesium	36 / 36	32,000	54,000	--	74,000	µg/L
	Sodium	36 / 36	27,100	42,600	27,000	--	µg/L
LF01GW06	Barium	31 / 31	24	770	22	--	µg/L
	Calcium	31 / 31	26,000	48,200	19,000	--	µg/L
	Magnesium	31 / 31	4,700	51,000	3,100	--	µg/L
	Sodium	31 / 31	8,800	42,000	6,200	--	µg/L
LF02GW04	Barium	28 / 28	80	790	76	--	µg/L
	Potassium	13 / 28	< 5,000 *	6,700	--	9,000	µg/L
	Total Dissolved Solids	22 / 22	400	931	340	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Three locations had new high and/or low concentrations of dissolved metals during the First Quarter 2006, but these appear to be attributed to natural fluctuations are not considered to be significant.

4.6 Total Metals Results

During the First Quarter 2006, the surface sample collected at El Polin Spring was analyzed for total metals by EPA Methods 6010/6020. Total metals results are presented in Table A-6-3. The table below summarizes new high and low total metals analytical results for the First Quarter 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Total							
EPSP01	Barium	3 / 3	79	82	75	--	µg/L
	Calcium	3 / 3	15,000	15,000	13,000	--	µg/L
	Chromium	3 / 3	30	31	28	--	µg/L
	Copper	2 / 3	< 1	1.1	--	1.2	µg/L
	Iron	3 / 3	230	450	180	--	µg/L
	Magnesium	3 / 3	83,000	86,000	74,000 *	--	µg/L
	Manganese	3 / 3	68	83	65	--	µg/L
	Sodium	3 / 3	31,000	31,000	27,000	--	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Although a new high copper and several new low concentrations of total metals were detected within EPSP01 during the First Quarter 2006, the concentrations were generally within the range of historical total metals results and are not considered to be significant.

4.7 Total Dissolved Solids Results

The concentrations of TDS measured at Fill Site 1, Landfill 2 and at El Polin Spring during the First Quarter 2006, are generally within the range of historically measured levels, with the exception of the new low TDS concentration detected in the sample from monitoring well LF02GW04 during the First Quarter 2006. A summary of TDS results for these areas are presented in Table A-6-3.

4.8 TPH Results

No TPH analyses were performed on any of the Fill Site 1 or Landfill 2 monitoring well or El Polin Spring samples during the First and Second Quarters 2006. A summary of historical TPH results for these areas is presented in Table A-6-4.

5.0 CONCLUSIONS & RECOMMENDATIONS

No significant trends were observed during the First and Second Quarters 2006. The sampling frequency at Fill Site 1 and Landfill 2 has been reduced to annual (Tables 1A and 1B) until a decision document is approved. Due to four consecutive quarters of non-detect results, monitoring wells 100GW101 and 104GW101 were removed from the sampling schedule following the First Quarter 2004. Abandonment of these wells will be proposed in the pending Group II Mini-CAP document.

Annual analysis of 22 dissolved metals will continue to be conducted at El Polin Spring for the purpose of comparing surface water analytical results to nearby groundwater results and evaluating the potential for human exposure. No additional changes to the groundwater monitoring program have been proposed at this site.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001.
The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - The QC laboratory nitrate results have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported.
The QC laboratory reported nitrate as NO3 concentrations (nitrate-NO3) which are 4.43 times higher than nitrate-N concentrations.
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

µg/L - micrograms per liter
NA - Not analyzed
ND - Not detected
PAHs - Polycyclic aromatic hydrocarbons
OCPs - Organochlorine pesticides
PCBs - Polychlorinated biphenyls
VOC - Volatile organic compound
MTBE - Methyl tertiary-butyl ether
SVOCs - Semivolatile organic compounds
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
CL suffix denotes a quality control duplicated sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.
The surface water sample collected from seep EPSP01 were analyzed for total metals during the First Quarter 2004.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes:
Groundwater elevation data collected on 6 March 2006.

Groundwater elevations for UBR02GW01 and UBR03GW01 were not used in groundwater contouring.

300GW01 was approved for removal from the groundwater monitoring program prior to the First Quarter 2006.

Landfill E wells DAEGW06 and DAEGW07 were not contoured, due to semi-confined and perched conditions, respectively. Whereas, well DAEGW101 was not contoured because it is screened in a deeper interval.

Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet
Vertical Datums: (groundwater) Presidio Lower Low Water (ft. PLLW) (topography) North American Vertical Datum, NAVD88

LANDFILL E
APPENDIX SECTION A-7
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill E is located in the east-central portion of the Presidio (Figure 1). The site is bounded by hillsides to the west and south, housing to the east, Quarry Road to the southeast, and Hicks Road and Barnard Avenue to the northwest (Figure A-7-1). The site elevation ranges from approximately 70 to 140 feet above the PLLW vertical datum.

The ravine east of Landfill E operated as a firing range, the former Barnard Avenue Protected Target Range, from 1910 to the mid-1920s (Montgomery Watson, 1996d). The southern portion of the range is currently covered by Landfill E. Filling began at Landfill E prior to 1946 and was terminated between 1965 and 1973 (ANL, 1989). Pop Hicks baseball field was constructed in the landfill area in the late 1950s (Montgomery Watson, 1996d).

Since August 1992, groundwater samples from Landfill E have been analyzed for TPH, VOCs, PAHs, OCPs and PCBs, chlorinated herbicides, metals, TDS and general chemistry. No OCPs, PCBs or chlorinated herbicides have ever been detected in groundwater at the site. Landfill E monitoring well analytical results are present in Tables A-7-1 through A-7-4 in this section.

Monitoring wells DAEGW03, DAEGW05, and DAEGW08 were also sampled for perchlorate and polybrominated diphenyl ether (PBDE) as part of the Trust's Emergent Chemical Study conducted at the request of the RWQCB during the First Quarter 2004. No perchlorate or PBDE was detected above laboratory reporting limits during the Emergent Chemical Study (Treadwell &Rollo, 2004b).

2.0 SITE DESCRIPTION AND GEOLOGY

Landfill E is located at the edge of the Northeastern Groundwater Area of the Marina Groundwater Basin (Figure 1). Depth to groundwater beneath Landfill E has ranged from approximately 9 to 60 feet bgs. The groundwater flow direction around Landfill E is generally northeasterly, toward Crissy Field (Montgomery Watson, 1997a).

A fenced field and a paved parking lot currently occupy the majority of the site (Figure A-7-1). Soils in the area of Landfill E generally consist of fill materials underlain by the Colma Formation and serpentinite bedrock. The fill material under the Landfill E footprint extends to a maximum depth of approximately 38 feet bgs. The debris fill consists of glass, brick, tile, and

other general construction debris (Dames & Moore, 1997). The fill layer is underlain by Colma Formation clay, silt, and sand. The Colma Formation is at least 25 feet thick. Franciscan Formation bedrock lies beneath the Colma Formation. The bedrock consists of weathered serpentinite and is found at depths ranging from 40 to 79 feet bgs (Montgomery Watson, 1997a).

3.0 LANDFILL E SITE INVESTIGATION

Erler and Kalinowski, Inc. (EKI) completed a field investigation for the Trust to further characterize the landfill in November and December 2002. The investigation consisted of the following:

- Conducting a seismic refraction and terrain conductivity survey (electromagnetic and geophysical surveys);
- Drilling 9 soil borings to depths ranging between 35 and 100 feet bgs (borings eventually completed into piezometers, monitoring wells and soil gas wells);
- Installing 3 soil gas wells (DAESG01 through DAESG03);
- Installing four monitoring wells (DAEGW101 through DAEGW104);
- Excavating 9 exploratory trenches throughout the site;
- Conducting a radiation survey across the site and screening of soils for radioactivity;
- Advancing 5 cone penetrometer test (CPT) borings to evaluate soil materials for geotechnical data and stratigraphy evaluation; and
- Installing two piezometers (DAEPZ101 and DAEPZ102).

The results of this field investigation are presented in the *Landfill E Field Sampling Report, Presidio of San Francisco, California* prepared by EKI and Golder Associates (Golder) and submitted to the agencies and RAB by the Presidio Trust in June 2003. A Focused Feasibility Study (FFS) for Landfill E was completed in 2005. A RAP is scheduled to be completed in 2008.

The 12 site wells and piezometers were surveyed by Towill Inc. (Towill) on 25 November 2002. The results of the Towill survey were approximately 0.5 feet lower than the previous survey results for DAEGW03 and DAEGW05. Treadwell & Rollo contracted Chaudhary and Associates (Chaudhary) to complete a survey of all new and existing Landfill E monitoring wells and piezometers on 5 June 2003 in order to obtain accurate and current top of casing elevations. These elevations are included in Table A-7-5.

4.0 GROUNDWATER MONITORING

Landfill E has 12 associated groundwater monitoring wells and piezometers (Figure A-7-1). During the First and Second Quarters 2006, groundwater elevation measurements were collected at all 12 wells and piezometers (Table A-7-5). In accordance with the proposed sampling schedule (Tables 1A and 1B), groundwater samples were collected from all 10 monitoring wells during the First Quarter 2006. No monitoring wells were scheduled for sampling during the Second Quarter 2006.

The proposed sampling schedule also included collecting surface water samples from Landfill E seep DAESP03 during both the First and Second Quarters 2006. The DAESP03 sample was collected during the First Quarter 2006 as proposed. However, the surface water seep was dry during the Second Quarter 2006 and no sample was collected. This seep typically only flows during the First Quarter when rainfall is heavy. The approximate location of DAESP03 is presented on Figure A-7-1.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006 at all site wells and piezometers. Groundwater elevations are presented in Table A-7-5. Water level meters were calibrated on 6 March and 22 May 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

First Quarter 2006 groundwater elevations ranged from 50.84 to 107.55 feet above PLLW in monitoring wells DAEGW04 and DAEGW06, respectively. A groundwater elevation map showing First Quarter 2006 groundwater contours and flow directions for Landfill E is included as Figure A-7-1. Groundwater flow was to the northeast following the general topographic trend, which is also consistent with previous interpretations. The groundwater gradient was calculated to be approximately 0.125 feet per foot, which is also consistent with previous quarters.

Second Quarter 2006 groundwater elevations ranged from 53.48 to 109.37 feet above PLLW in monitoring wells DAEGW04 and DAEGW06, respectively. A groundwater elevation map showing Second Quarter 2006 groundwater contours and flow directions for Landfill E is included as Figure A-7-2. Groundwater was determined to flow to the northeast following the general topographic trend, which is consistent with previous interpretations. The groundwater gradient was calculated to be approximately 0.125 feet per foot, which is also consistent with previous quarters.

The groundwater elevations for the First and Second Quarters 2006 are generally within the range of historical elevations measured at the site. Groundwater elevations from wells DAEGW06 and DAEGW07 have not been used in calculating groundwater gradients or determining flow directions during these or previous quarters. Monitoring well DAEGW06 had

a groundwater elevation of 107.55 feet above PLLW during the First Quarter 2006 and an elevation of 109.37 feet above PLLW during the Second Quarter 2006. This well is located southwest of the other site wells and was previously interpreted as being installed in a semi-confined aquifer. Groundwater within well DAEGW07 was measured at 73.91 feet above PLLW during the First Quarter 2006 and at 70.65 feet above PLLW during the Second Quarter 2006. These groundwater elevations represent perched groundwater conditions. Wells DAEGW03, DAEGW04, DAEGW05, DAEGW08, DAEGW102 through DAEGW104 and piezometers DAEPZ101 and DAEPZ102 are screened in an unconfined aquifer (Montgomery Watson, 1999d and EKI & Golder Associates, 2003).

4.2 Monitoring Well Purging and Sampling

During the First Quarter 2006, all Landfill E monitoring wells were sampled on 14, 15, and/or 16 March 2006. The surface water sample from location DAESP03 was collected on 8 March 2006. No surface water sample was collected from location DAESP03, which was dry during the Second Quarter 2005.

All First Quarter 2006 groundwater samples were collected using methods shown in Table 1A, and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purge equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon aboveground polyethylene storage tank located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main report discusses the QA/QC sampling and analysis performed during the First Quarter 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

All Landfill E monitoring wells and the Landfill E seep (DAESP03) were sampled during the First Quarter 2006. No monitoring wells were sampled during the Second Quarter 2006. Seep DAESP03 was scheduled to be sampled during the Second Quarter 2006 but was dry. In accordance with the approved sampling schedules (Tables 1A and 1B), samples collected during the First Quarter 2006 were analyzed for some or all of the following: general chemistry parameters, metheylene blue active substances (MBAS), total hardness, molybdenum, TDS,

OCPs, PCBs, VOCs, PAHs, SVOCs, cyanide, TPHg, TPHd, and TPHfo, and 22 or 23 dissolved/total metals.

The primary and duplicate MBAS samples collected from DAESP03 on 8 March 2006 were not analyzed by the laboratory due to a lack of extraction solvent at the laboratory and therefore, the analyses were cancelled. The QC duplicate sampled collected for MBAS on 8 March 2006 was analyzed by the QC laboratory, as requested. Seep DAESP03 was re-sampled for MBAS on 24 March 2006 and a sample was submitted to the primary laboratory.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-7-1. During the First Quarter 2006, dissolved oxygen was measured at concentrations ranging from 0.08 mg/L in monitoring well DAEGW104 to 4.84 mg/L in monitoring well DAEGW103. Dissolved oxygen was measured at a concentration of 7.23 mg/L during the First Quarter 2006 in the seep sample DAESP03. Dissolved oxygen was detected at new low concentrations within two monitoring wells and the seep. The new low concentration within monitoring well DAEGW104 was significantly lower than the previous low concentration for this well. Dissolved oxygen levels will continue to be monitored during future sampling events to assess apparent trends.

5.2 General Chemistry and Total Hardness Results

General chemistry results are presented in Table A-7-1. Most general chemistry results for the First Quarter 2006 at Landfill E are within historical ranges. The table below summarizes new high and low general chemistry analytical results for the First Quarter 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
DAEGW06	Alkalinity, Total	31 / 31	208	309	200	--	mg/L
	Bicarbonate	31 / 31	208	309	200	--	mg/L
DAEGW101	Alkalinity, Total	8 / 8	770	840	--	870	mg/L
	Bicarbonate	8 / 8	770	840	--	870	mg/L
	Sulfate	8 / 8	100	130	87	--	mg/L
DAEGW102	Chloride	11 / 11	380	840	370	--	mg/L
	Nitrate	11 / 11	0.21	1	0.11	--	mg/L
	Sulfate	11 / 11	260	410	240	--	mg/L
DAEGW103	Alkalinity, Total	29 / 29	230	360	110	--	mg/L
	Chloride	29 / 29	130	153	59	--	mg/L
	Nitrate	27 / 27	3.8	4.5 *	--	5.2	mg/L

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
	Sulfate	29 / 29	65	91	35	--	mg/L
	Total Hardness	29 / 29	270	540	210	--	mg/L
DAEGW104	Total Hardness	15 / 15	290	560	260	--	mg/L
DAESP03	Alkalinity, Total	6 / 6	41	61	--	89	mg/L
	Bicarbonate	6 / 6	41	61	--	89	mg/L
	Chloride	6 / 6	20	22	--	30	mg/L
DAESP03	MBAS	1 / 2	NA	NA	< 1	0.05	µg/L
	N as Nitrite	1 / 6	< 0.05	< 0.05	--	0.027	mg/L
	Nitrate	6 / 6	1	1.6	--	1.7	mg/L
	Sulfate	6 / 6	7.8	9.5	--	16	mg/L
	Total Hardness	3 / 3	95	95	--	110	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Five wells and the seep DAESP03 had new high and/or low concentrations for general chemistry parameters during the First or Second Quarters 2006. However, these new high and low concentrations are not significantly different than previous concentrations and can be attributed to natural fluctuations and are not considered significant.

5.3 TPH Results

TPH results are presented in Table A-7-2. During the First Quarter 2006, samples collected from DAEGW101 and DAEGW104 had reported concentrations of TPHd at 65 µg/L and of 54 µg/L, respectively. This is the first time a primary sample collected from this well had a reported concentration of TPHd above the laboratory reporting limit of 50 µg/L. Therefore, TPHd samples will continue to be collected from monitoring well DAEGW104 during future sampling events to see if there is an apparent trend. TPHd was detected in the primary, duplicate and QC samples collected from surface seep DAESP03 at concentrations of 55 µg/L, 63 µg/L, and 58 µg/L. However, TPHd has only been sampled at the surface seep during two sampling events, and additional data is needed to determine if this is a consistent trend. TPH was not detected above the laboratory reporting limit in any other samples collected from Landfill E monitoring wells during the First Quarter 2006.

5.4 VOC Results

VOC results are presented in Table A-7-3. Benzene was detected within samples collected from monitoring wells DAEGW03 and DAEGW04 at concentrations of 0.3 µg/L and 0.2 µg/L, respectively. This is the first time benzene has been detected in samples from DAEGW04. Benzene has been detected at similar concentrations on one previous occasion at DAEGW03, DAEGW102, and DAEGW104. No other VOC compounds were detected above laboratory

detection limits within Landfill E monitoring well samples or the surface seep during the First Quarter 2006.

5.5 PAH, OCP, and PCB Results

PAHs, OCPs, and PCBs were analyzed during the First Quarter 2006 and results are presented in Table A-7-3. No PAHs, OCPs, or PCBs were detected within any of the groundwater samples collected from Landfill E monitoring wells during the First Quarter 2006.

5.6 Dissolved Metals Results

Dissolved metals results are presented in Table A-7-4. The table below summarizes new high and low dissolved metals results detected during the First Quarter 2006 when compared to previous sampling events, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
DAEGW03	Cadmium	18 / 31	< 0.5	11.2	--	20	µg/L
	Cadmium	18 / 31	< 0.5 *	11.2	--	20	µg/L

	Total Dissolved Solids	4 / 4	330	330	326	400	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Several locations had new high or low dissolved metals results during the First 2006. The majority of these can be attributed to natural fluctuations and are not considered to be significant, with the following exceptions:

- Iron was not detected above the laboratory reporting limit during the First Quarter 2006 in monitoring wells DAEGW101 and DAEGW102 for the first time since monitoring for dissolved metals began at these wells in First Quarter 2003.

- Chromium was not detected above the laboratory reporting limit during the First Quarter 2006 in monitoring well DAEGW103 for the first time since monitoring for dissolved metals began at this well in First Quarter 2003.

- Manganese was detected during the First Quarter 2006 in monitoring well DAEGW03 at a concentration of 2,900 µg/L, which is significantly higher than the previous high concentration of 316 µg/L detected within this well.

- Thallium was detected during the First Quarter 2006 in monitoring well DAEGW101 at a concentration of 1.1 µg/L just above the laboratory reporting limit of 1.0 µg/L. Thallium has not been detected within samples from this well.

- Copper was detected during the First Quarter 2006 in monitoring well DAEGW103 at a concentration of 14 µg/L, which is significantly higher than recent detected concentrations within this well.

- Lead was detected during the First Quarter 2006 in monitoring well DAEGW103 at a concentration of 3.8 µg/L. Lead has not previously been detected above the laboratory reporting limit within this well since Fourth Quarter 2002.

- Nickel was detected during the First Quarter 2006 in monitoring well DAEGW103 at a concentration of 20 µg/L, which is significantly higher than recent detected concentrations.

- Aluminum was detected during the First Quarter 2006 in the primary, duplicate, and QC sample from surface seep DAESP03 at concentrations of 130, 100, and 140 µg/L. Aluminum has previously not been detected above the laboratory reporting limit within this well. Dissolved aluminum detections can be indicative of filter breakthrough; however, the majority of the other metals detected within these samples were within the range of previously detected metals concentrations within this well.

The potential for increasing manganese, thallium, copper, lead, nickel and aluminum concentrations at Landfill E will be evaluated during future monitoring events.

In addition to dissolved metals, total metals were also analyzed for the second time within a DAESP03 sample during the First Quarter 2006 (Table A-7-4). Thus, adequate historical data is not available to evaluate trends in total metal concentrations. Significant total metal concentrations are discussed below.

- Total aluminum was detected at a concentration of 6,500 µg/L.

- Total chromium was detected at a concentration of 70 µg/L.

- Total iron was detected at a concentration of 9,800 µg/L.

- Total dissolved manganese was detected at a concentration of 130 µg/L.

Total metals will continue to be monitored within this seep when possible.

5.7 MBAS, Total Hardness, and Molybdenum Results

MBAS and total hardness results are presented in Table A-7-2. Molybdenum results are presented in Table A-7-4. Samples collected from monitoring wells DAEGW101 through DAEGW104 and from seep DAESP03 were the only Landfill E samples analyzed for MBAS and total hardness during the First and Second Quarters 2006.

During the First Quarter 2006, MBAS were detected at a new low concentration of 0.11 mg/L within well DAEGW101. MBAS was also detected within the QC duplicate sample collected on 8 March 2006 from DAESP03 at a concentration of 0.5 mg/L. The primary and duplicate samples collected from DAESP03 for MBAS on 8 March 2006 were cancelled at the laboratory due to a lack of extraction solvent at the laboratory. Seep DAESP03 was re-sampled for MBAS

on 24 March 2006. MBAS was not detected by the primary laboratory within the sample collected on 24 March 2006.

MBAS were not detected above laboratory detection limits within DAEGW101, DAEGW102, or DAEGW104. Total hardness ranged from 107 to 1,300 mg/L within Landfill E monitoring well and seep samples during the First Quarter 2006. Total hardness was detected at a concentrations of 210 mg/L and 260 mg/L within DAEGW103 and DAEGW104, respectively, which are new low concentrations for these monitoring wells.

Total hardness was detected at a concentration of 120 mg/L within seep DAESP03, which is a new high concentration.

Molybdenum was not detected above the laboratory reporting limit in any of the samples collected for analysis during the First Quarter 2006. The majority of previous molybdenum results have been non-detect at reporting limits ranging from 5 to 20 µg/L. The two exceptions were a molybdenum detection of 10 µg/L in DAEGW104 during the Fourth Quarter 2002 and a detection of 51 µg/L in the QC duplicate sample DAEGW103CL during the Third Quarter 2004. The primary and duplicate samples collected from DAEGW103 during the Third Quarter 2004 had no molybdenum detected above the laboratory reporting limit of 20 µg/L.

6.0 CONCLUSIONS & RECOMMENDATIONS

Groundwater elevations, gradients, and flow directions are consistent with historical values and interpretations. No significant trends or observations were identified at Landfill E during the First and Second Quarters 2006.

During the First Quarter 2006, the samples collected from DAEGW101 and DAEGW104 had a reported concentration of TPHd of 65 and 54 µg/L, respectively. TPHd was also detected at similar concentrations in samples from DAESP03. TPHd was previously detected in DAEGW104 in the First Quarter 2005, but was not previously present at DAEGW101. No other TPH was detected above the laboratory reporting limit in any other samples collected from Landfill E monitoring wells during the First Quarter 2006.

No VOCs, PAHs, OCPs, or PCBs were detected within any of the groundwater samples collected from Landfill E monitoring wells during the First Quarter 2006.

A FFS has been prepared for Landfill E. The reduction to annual sampling at monitoring wells DAEGW03 through DAEGW08 until a Landfill E RAP have been finalized was approved by the stakeholders prior to First Quarter 2004. Sampling will be performed per the RAP once it has been finalized and implemented.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in their respective quarterly reports.
2 - This sample was labeled LFE-GW on the chain of custody and was reported by the laboratory as LFE-GW. This sample ID (LFE-GW) has been changed within the text, tables and database to reflect the historic name of this seep (DAESP03).
3 - This sample was labeled LFE-GWD on the chain of custody and was reported by the laboratory as LFE-GWD. In accordance with the QAPP, this sample ID (LFE-GWD) was changed to DUP112801 within the text, tables and database.
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical method used during previous quarters are identified in the respective quarterly reports.
mg/L - milligrams per liter
µg/L - micrograms per liter
NA - Not analyzed
MBAS - Methylene Blue Active Substances
TPH - Total petroleum hydrocarbons
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which the were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
µg/L - micrograms per liter
NA - Not analyzed
ND - Not detected
PAHs - Polycyclic aromatic hydrocarbons
OCPs - Organochlorine pesticides
PCBs - Polychlorinated biphenyls
VOCs - Volatile organic compounds
SVOCs - Semi-volatile organic compounds
MTBE - Methyl tert-butyl ether
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - This sample was labeled LFE-GW on the chain of custody and was reported by the laboratory as LFE-GW. This sample ID (LFE-GW) has been changed within the text, tables, and database to reflect the historical name of this seep (DAESP03).
3 - This sample was labeled LFE-GWD on the chain of custody and was reported by the laboratory as LFE-GWD. In accordance with the QAPP, this sample ID (LFE-GWD) was changed to DUP112801 within the text, tables, and database.
4 - Dissolved metals were analyzed by the quality control laboratory using method E200.7 on an Inductively Coupled Plasma (ICP) instrument. The primary laboratory analyzed dissolved metals by EPA Method 6020 on an ICP/Mass Spectrometry (ICP/MS) instrument. Although variability between these two methods is not expected, the variability in the data may be a result of different analytical methods used.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

	08/11/03	Not flowing	--	--	Surface
	06/02/03	Not flowing	--	--	Surface

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - The limited amount of water observed within this well most likely represents water in the end cap not representative of the natural aquifer.
MW- Monitoring well
PZ - piezometer
feet PLLW - feet above Presidio lower low water vertical datum

LEGEND

DAEGW04 50.84 — Groundwater Monitoring Well March 2006 Groundwater Elevation

DAEPZ101 91.69 — Piezometer March 2006 Groundwater Elevation

DAESP03 — Approximate Surface Water Sample Location

* Wells DAEGW06 and DAEGW07 were not contoured, due to semi-confined and perched conditions, respectively. Whereas, well DAEGW101 was not contoured because it is screened in a shallower interval.

Approximate Direction of Groundwater Flow

Groundwater Elevation Contour (Contour Interval : 5 ft)

Topographic Contour (Contour Interval : 10 ft)

810 — Building and Number

Approximate Lateral Extent of Landfill

Notes:
Groundwater elevation data collected on 6 March 2006.

Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet

Vertical Datums: (groundwater) Presidio Lower Low Water (ft. PLLW) (topography) North American Vertical Datum, NAVD88

LANDFILL 4
APPENDIX SECTION A-8
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Landfill 4 (LF 4) is located in the west-central portion of the Presidio (Figure 1) between Central Magazine Road and Hitchcock Street. The site elevation ranges from 285 to 325 feet above the PLLW vertical datum (Figure A-8-1).

LF 4 operated between 1946 and 1981 and was used to dispose of debris and fill material. In 1981, Landfill 4 was closed and a 3-foot-thick soil cap was placed over the debris (ANL, 1989). The landfill contained up to 14 vertical feet of debris material, reportedly consisting of a variety of different materials that potentially include chemical wastes from various Presidio facilities. Fill materials also included brick, glassware, gravel, concrete, pipes, battery caps, and plastic (Dames & Moore, 1997). Figure A-8-1 shows the site and the approximate lateral extent of the former landfill.

Two monitoring wells, LF4GW100 and LF4GW101, were installed at the LF 4 site in July and August 2000 by the Trust (Figure A-8-1) to supplement existing monitoring well LF04GW03 (EKI, 2000a). Monitoring wells LF4GW100 and LF4GW101 were completed at 22.5 and 22.8 feet bgs, respectively. Monitoring well LF4GW100 is screened within silt, silty sand, and sand units and extends 0.5 feet into weathered bedrock. Monitoring well LF4GW101 is screened within a clay layer and does not extend into the weathered bedrock. Groundwater was not encountered in either well during or after construction. Groundwater was not observed in monitoring well LF04GW03 during the construction of the other two wells. The occurrence of groundwater in monitoring wells LF04GW03, LF4GW100 and LF4GW101 is seasonal; these wells do not typically contain adequate groundwater for sampling. Additional wells have been installed as part of the recent remedial action activities discussed in Section 3.0.

Well LF04GW03 has been sampled at irregular intervals from April 1995 to May 2005, which was the last time this well contained sufficient water to sample. Groundwater samples from well LF04GW03 have been analyzed for general chemistry parameters, TPH, metals, and TDS. LF4GW100 has not contained enough water for sampling. LF4GW101 has only been sampled once, during the First Quarter 2005 and was analyzed for all LF 4 parameters. Summaries of general chemistry, dissolved oxygen, TPH, PAH, chlorinated herbicides, OCP, PCB, VOCs, and metals results for LF 4 groundwater samples are presented in Tables A-8-1 through A-8-3.

2.0 SITE DESCRIPTION AND GEOLOGY

LF 4 is located in the southwestern portion of the Marina Groundwater Basin. Groundwater beneath LF 4 has reportedly ranged from approximately 14 to greater than 45 feet bgs. Groundwater flows in a north-northeasterly direction following the general topographic trend (Figures A-8-1 and A-8-2).

As outlined in Section 3.0, following remedial excavation, five new groundwater monitoring wells were installed in the vicinity of former LF 4. Materials encountered while drilling soil borings for installation of monitoring wells LF4GW102 through LF4GW106 generally consisted of dune sand to depths ranging between 6 to 14 feet bgs over silty sand of the Colma Formation to depths between 19 to 46.5 feet bgs. All borings were terminated in Franciscan complex shales and serpentinite to depths ranging between 40 and 48.5 feet bgs. Saturated soils were encountered at approximately 31.5 feet bgs in the boring for LF4GW106 and at a depth of 42.5 feet bgs in the soil boring for LF4GW105.

Well LF4GW102 is located upgradient of the excavated area, near the southern edge of Central Magazine Road (Figure A-8-1). Well LF4GW106 is located within the excavated portion of former LF 4. Wells LF4GW103, LF4GW104, and LF4GW105 are located downgradient of the excavated portion of former LF 4. At wells LF4GW102, LF4GW103, LF4GW104, and LF4GW106, the groundwater surface is located within the Franciscan complex bedrock. At well LF4GW105, the groundwater surface is located near the bottom of the 32.5-foot thick Colma formation, four feet above the Franciscan complex contact (Treadwell & Rollo, 2003e).

3.0 REMEDIAL ACTION

The *Remedial Action Plan and Evaluation of Alternatives (RAP) for Landfill 4 and Fill Site 5* selected excavation, recycling, and offsite disposal of impacted fill material and underlying soil, along with groundwater monitoring, as the remedial alternative for LF 4. The goal of the remediation at LF 4 was to remove all contaminated material, leaving in place soil that meets the established cleanup levels (Treadwell & Rollo, 2002e).

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes and residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standards or the cleanup levels presented in Section 3 of the RAP for three years. Table 3-10 from the RAP summarizes groundwater cleanup levels applicable to LF 4 and is included in this section.

Between 9 January and 14 February 2003, a total of 14,623 tons (approximately 11,698 yd^3) of waste material was removed from former LF 4. The majority of the material (13,551 tons) was disposed as Class I California Hazardous Waste based on soluble lead concentrations. Soil

confirmation sample concentrations determined that the majority of site conditions after the removal action meet the goals presented in the RAP (Treadwell & Rollo, 2003e).

Additional soil sampling to complete the soil cleanup activities at LF 4 has been completed and documented in the *Draft Construction Completion Report Landfill 4 and Fill Site 5* (CCR) which was submitted for stakeholder review in the Fourth Quarter 2004 (Treadwell & Rollo, 2004e). Between 7 February and 25 April 2003, a total of 12,393 tons of waste material was removed from the former FS 5 site, with an approximate additional 40 cubic yards of Class II waste removed in September 2004. Approximately 90 percent of the fill material was disposed at Class II and Class III disposal sites and the remainder as Class I California Hazardous Waste. Soil confirmation sample concentrations or 95% UCL calculations for all compounds tested (both COC and non-COC compounds) determine that the site soil conditions meet the goals presented in the RAP and that the site is suitable for unrestricted use. Based on the remedial activities conducted, field observations, established cleanup levels, and a review and evaluation of the confirmation sampling results, LF 4 and FS 5 are recommended for construction completion. Groundwater monitoring will continue per the RAP for three years to confirm that applicable cleanup levels are not exceeded (Treadwell & Rollo, 2002e).

Between 19 February and 5 March 2003, approximately 2,970 cubic yards of imported backfill material (Letterman Colma Backfill Soil) was delivered to the site. The Letterman Colma backfill was used to buttress the northern side of Central Magazine Road and contour the slope for erosion control. The source for the LF 4 imported material was the Letterman redevelopment project Colma excavation spoils.

Following the removal action and subsequent soil import, five new monitoring wells (LF4GW102 through LF4GW106) were installed in February 2003 in the locations shown on Figure A-8-1. The new wells were added to the Presidio Quarterly Groundwater Monitoring Program beginning with the First Quarter 2003 and will be sampled quarterly for a minimum of three years, in accordance with the RAP. Monitoring wells LF04GW03, LF4GW100, and LF4GW101 will continue to be monitored for the presence of water and sampled when sufficient water is present.

Treadwell & Rollo sampled the imported Letterman Colma Backfill Soil (Colma Fill) at LF 4 for OCPs in accordance with the *Field Sampling Plan to Evaluate Possible Chlordane in Letterman Colma Backfill Soil* dated 28 February 2006. The purpose of the soil sampling was to characterize the Colma Fill at LF 4 for the occurrence of chlordane above site specific soil cleanup levels. The analytical results of this sampling are currently pending.

4.0 GROUNDWATER MONITORING

LF 4 has eight monitoring wells (LF04GW03 and LF4GW100 through LF4GW106) associated with the LF 4 groundwater monitoring program (Figure A-8-1). First and Second Quarter 2006

groundwater elevations were measured at all LF 4 monitoring wells on 6 March and 22 May 2006, respectively (Table A-8-4).

The post-remediation groundwater monitoring requirements from the RAP have been met at all Landfill 4 monitoring wells for TPH, PAHs, VOCs, OCPs, and chlorinated herbicides. These analytes were not included in the proposed sampling for the First and Second Quarter 2006. Only monitoring wells LF4GW103 and LF4GW104 were proposed for sampling during the First and Second Quarter 2006 (Tables 1A and 1B), based on recent exceedences of dissolved nickel, and PCB aroclor 1260.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006 in all LF 4 monitoring wells during the First and Second Quarters 2006. Groundwater elevations are summarized in Table A-8-4. Water level meters were calibrated on 6 March and 22 May 2006, and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the First Quarter 2006, the groundwater elevations ranged from 269.52 to 306.25 feet above PLLW in monitoring wells LF4GW105 and LF4GW102, respectively (Figure A-8-1). Although monitoring wells LF04GW03, LF4GW100, and LF4GW101 are usually dry, they contained a sufficient amount of water during the First Quarter 2006 to measure the groundwater elevations.

During the Second Quarter 2006, the groundwater elevations ranged from 275.46 to 312.38 feet above PLLW in monitoring wells LF4GW105 and LF4GW102, respectively (Figure A-8-2). Monitoring wells LF04GW03, LF4GW100, and LF4GW101 again contained a sufficient amount of water during the Second Quarter 2006 to measure the groundwater elevations.

Groundwater gradients were in a northeasterly direction and estimated to be approximately 0.10 feet per foot during both the First and Second Quarters 2006. Groundwater gradients observed during the First and Second Quarters 2006 are consistent with previous monitoring events.

4.2 Monitoring Well Purging and Sampling

During the First Quarter 2006, monitoring wells LF4GW103 and LF4GW104 were sampled on 7 March, in accordance with the proposed sampling schedule contained in Table 1A.

During the Second Quarter 2006, monitoring wells LF4GW103 and LF4GW104 were sampled on 22 May, in accordance with the proposed sampling schedule contained in Table 1B

Purge equipment, purging volumes, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in a 2,800-gallon aboveground polyethylene storage tank located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used at each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed during the First and Second Quarters 2006.

5.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected from LF 4 monitoring wells during the First Quarter 2006 were analyzed for general chemistry, TDS, PCBs, and 23 dissolved metals. The groundwater samples collected from LF 4 monitoring wells during the Second Quarter 2006 were analyzed for general chemistry, TDS, and 23 dissolved metals.

Hexavalent chromium analysis was removed from the LF 4 groundwater monitoring schedule beginning with the Second Quarter 2003. Chromium primarily exists in three valence states in nature; chromium(0), trivalent chromium, and hexavalent chromium. Hexavalent chromium is more soluble than both chromium(0) and trivalent chromium and, therefore, the majority of dissolved chromium likely consists of hexavalent chromium.

Beginning in Second Quarter 2003, seven metals (arsenic, barium, beryllium, chromium, cobalt, nickel, and zinc), which were previously analyzed by EPA Method 6020 were granted variance from the QAPP reporting limits by the stakeholders and were analyzed using EPA Method 6010. This change in analytical method has resulted in a slight increase of laboratory reporting limits for these metals.

Based on the post-remediation groundwater requirements from the RAP being met at Landfill 4 monitoring wells for TPH, PAHs, VOCs, OCPs, and chlorinated herbicides, these analytes were not included in the proposed sampling for the First and Second Quarter 2006. Only monitoring wells LF4GW103 and LF4GW104 were proposed for sampling during the First and Second Quarter 2006 (Tables 1A and 1B), based on recent exceedences of dissolved nickel, PCB aroclor 1260 and fluctuating concentrations of general chemistry parameters.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-8-1. During the First Quarter 2006, dissolved oxygen was measured at 0.4 mg/L in monitoring well LF04GW03 and 0.11 mg/L in monitoring well LF04GW04. The dissolved oxygen concentrations measured during the First Quarter 2006 are within the range of concentrations previously measured within Landfill 4 monitoring wells.

During the Second Quarter 2006, dissolved oxygen was measured 3.71 mg/L in LF04GW03 and 2.4 mg/L in monitoring well LF04GW04. The dissolved oxygen measurements in monitoring wells LF04GW03 and LF04GW04 were new high concentrations for these wells.

5.2 General Chemistry

General chemistry results are presented in Table A-8-1. General chemistry concentrations during the First and Second Quarters 2006 are generally consistent with values reported at other areas of the Presidio. However, some general chemistry concentrations are slightly above or below previous high or low concentrations within LF 4 monitoring wells. The table below summarizes new high and low general chemistry analytical results for the First and Second Quarters 2006 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the commencement date of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
LF4GW103	Alkalinity, Total	14 / 14	240	1,100	--	1,300	mg/L
	Bicarbonate	14 / 14	240	1,100	--	1,300	mg/L
	Chloride	14 / 14	140	300	--	601	mg/L
	Dissolved Oxygen	12 / 12	0.1	0.92	--	3.71	mg/L
	Nitrate	3 / 14	< 0.05	0.06	--	0.07	mg/L
	Sulfate	14 / 14	36	330	--	428	mg/L
LF4GW104	Chloride	15 / 15	230	320	--	360	mg/L
	Dissolved Oxygen	12 / 12	0.07	0.5	--	2.4	mg/L
	Sulfate	15 / 15	130	151	--	170	mg/L

General chemistry concentrations listed above are only slightly outside of the range of previously reported concentrations and are therefore not considered to be significant. General chemistry parameters at the site have remained relatively stable. The potential for increasing or decreasing general chemistry concentration trends at the site will continue to be evaluated in future monitoring events.

5.3 PCB Results

PCB results, along with RAP-specified cleanup levels, are presented in Table A-8-2. LF4GW103 and LF4GW104 groundwater samples collected during the First Quarter 2006 were analyzed for PCBs. PCBs were not detected in the samples collected during the First Quarter 2006. PCBs were not scheduled for analysis during the Second Quarter 2006. Only chlorodiphenyl (PCB aroclor 1260) has been detected once at 1 µg/L in the Third Quarter 2005 QC duplicate sample for LF4GW104. No other PCB detections have occurred in LF 4 groundwater samples.

5.4 Dissolved Metals Results

Dissolved metals results, along with RAP-specified cleanup levels, are presented in Table A-8-3.

The table below summarizes new high and low dissolved metals results for the First and Second Quarters 2006 within LF4GW103 and LF4GW104 when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the commencement date of sampling, and the number of duplicate analyses performed. All detected concentrations for metals were below the established cleanup levels for groundwater.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
LF4GW103	Calcium	14 / 14	1,700 *	110,000	--	160,000	µg/L
	Copper	6 / 14	< 1	1.1	--	2.3	µg/L
	Magnesium	14 / 14	4,100	330,000	--	470,000	µg/L
	Manganese	14 / 14	46	170	37	--	µg/L
	Sodium	14 / 14	4,700	130,000	--	190,000	µg/L
	Total Dissolved Solids	13 / 13	370	1,900	--	2,890	mg/L
LF4GW104	Copper	4 / 15	< 1	1.1	--	1.2	µg/L
	Nickel	6 / 15	< 20	21	--	22	µg/L
	Total Dissolved Solids	14 / 14	950	1,360	--	1,800	mg/L

Qualified data in the table above is indicated with an asterisk (*).

The dissolved metals concentrations listed above were only slightly outside of the range of previously reported concentrations and/or were not considered to be significant. Dissolved metals at the site have remained relatively stable. With the exception of nickel in monitoring well LFGW103, no dissolved metal concentrations within LF 4 groundwater samples have ever exceeded RAP-specified cleanup levels.

6.0 CONCLUSIONS & RECOMMENDATIONS

General chemistry parameters at the site have remained relatively stable.

One PCB aroclor 1260 was detected above the RAP cleanup level in the LF4GW104, QC duplicate sample in the Third Quarter 2005. No other PCB detections have occurred in any LF 4 groundwater samples.

Dissolved metals concentrations at the site have remained relatively stable The potential for increasing or decreasing dissolved nickel concentrations within monitoring wells LF4GW103 and LF4GW104 will continue to be evaluated in future monitoring events, in accordance with the RAP.

With the exception of beta-BHC, PCB aroclor 1260, and nickel, no RAP-specified cleanup levels have been exceeded within LF 4 monitoring well samples to date.

No significant trends were observed in the samples collected during the First and Second Quarters 2006.

Notes
mg/L - milligrams per liter
NA - not analyzed
NM - not measured
1 - The identified analytical method(s) are for analyses performed in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Nitrite as N prior to May 2001 analysis includes nitrate as N.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
µg/L - micrograms per liter
NA - not analyzed
ND - not detected
1 - The identified analytical method(s) are for analyses performed in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - USEPA Region IX tap water preliminary remediation goal (PRG).
3 - From Table 7-6 of the Cleanup Levels Document.
4 - The RAP does not list a cleanup level for beta-BHC; however, the RAP states that when chemicals are encountered in groundwater and cleanup levels are not listed, the default should be Tap Water PRGs. The Tap Water PRG for beta-BHC (HCH-beta) is 0.037 µg/L.
VOC - volatile organic compound
TPH - total petroleum hydrocarbons
PCE - tetrachloroethene
TCE - trichloroethene
PCBs - polychlorinated biphenyls
PAHs - polycyclic aromatic hydrocarbons
OCPs - organochlorine pesticides
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - USEPA Region IX tap water preliminary remediation goal (PRG).
3 - Dissolved metals were analyzed by the quality control laboratory using method E200.7 on an Inductively Coupled Plasma (ICP) instrument.
The primary laboratory analyzed dissolved metals by EPA Method 6020 on an ICP/Mass Spectrometry (ICP/MS) instrument. Although variability between these two methods is not expected, the variability in the data may be a result of different instruments used.
NA - not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Groundwater samples collected from all site monitoring wells were field filtered and analyzed for dissolved metals.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
-- - Cleanup criteria not established
µg/L - micrograms per liter
mg/L -milligrams per liter

	08/11/03	28.14	311.36	283.22	MW
	06/02/03	28.59	311.36	282.77	MW
	03/10/03	31.09	311.36	280.27	MW

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - Elevation indicates bottom-of-casing elevation.
3 - The well construction details for this well indicate that the bottom of the casing is 22.5' from the ground surface; however, this well also has 2.04' of casing above grade. Therefore, the bottom of casing elevation has been recalculated for this well to be 24.54' from the top of casing elevation.

FILL SITE 5
APPENDIX SECTION A-9
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

Fill Site 5 (FS 5) is located in the western portion of the Presidio (Figure 1) between Lincoln Boulevard and Washington Boulevard, adjacent to the World War II Memorial (Figure A-9-1). The FS 5 site is approximately 270 to 320 feet above the PLLW datum.

FS 5 was reportedly used by the Army for the disposal of debris and municipal waste from approximately 1946 to 1981 (Dames & Moore, 1997), although historical aerial photographs indicate that the area was disturbed (non-vegetated) as early as 1935. FS 5 was reportedly used when inclement weather rendered disposal at Landfill 4 difficult. The site was used for disposal of building debris, fill dirt, landscape waste, and municipal waste. However, filling activities at FS 5 may have ceased as early as 1948, when a structure (former Building 1351) was erected.

No groundwater was encountered during the Army's RI activities at FS 5; thus no groundwater monitoring wells were installed (Dames & Moore, 1997). Montgomery Watson installed three wells (1349MW01, 1349MW02, and 1349MW03) in 1995 as part of the Army's investigation at the nearby Building 1349 area. The locations of these wells are shown on Figure A-9-1.

In July 2000, the Trust constructed two new groundwater monitoring wells (LF5GW100 and LF5GW101) in the presumed downgradient groundwater flow direction from FS 5 (Figure A-9-1).

In accordance with the RAP (Treadwell & Rollo, 2003e) and the Building 1349 Site Investigation (SI) (Treadwell & Rollo, 2003d), six new (1349MW100 through 1349MW102 and LF5GW102 through LF5GW104) and one replacement (1349MW03R) groundwater monitoring wells were installed in the vicinity of former FS 5. The original well 1349MW03 was abandoned prior to the beginning of remedial excavation at former FS 5. The FS 5 remedial action and Building 1349 SI are detailed below in Section 3.0 and also in Appendix A, Section A-5. Monitoring wells 1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102 are either within the former footprint of FS 5 or upgradient of FS 5 and therefore, these wells are included in the FS 5 groundwater monitoring plan. Conversely, monitoring wells 1349MW103 through 1349MW105 are located on the opposite side, when compared to Fill Site 5, of the topographic high point associated with the Building 1349 Area. The groundwater flow direction in this area varies from the northeast to the northwest and away

from FS 5, therefore, these wells (1349MW103 through 1349MW105) are not included in the FS 5 groundwater monitoring plan.

Since the Second Quarter 2001, all FS 5 and the associated Building 1349 wells, which are within or directly upgradient of the former FS 5 footprint, have been sampled and analyzed for general chemistry parameters, TPH, VOCs, OCPs, PCBs, PAHs, chlorinated herbicides, dissolved metals and TDS. Summaries of previous analytical results are presented in Tables A-9-1 through A-9-7.

2.0 SITE DESCRIPTION AND GEOLOGY

Materials encountered while drilling soil borings for installation of LF5GW103, LF5GW104, and 1349MW03R consisted of clayey to silty sand of the Colma Formation to depths ranging between 7.5 to 13.5 feet bgs over Franciscan complex serpentinite to the maximum explored depths ranging between 23.5 and 36 feet bgs. Materials encountered while drilling soil boring LF5GW102, although similar to the other soil borings, included dune sand from the ground surface to a depth of 5.5 feet bgs, and silty sand Colma Formation to a depth of 26 feet bgs over Franciscan complex serpentine to the maximum depth explored of 40 feet bgs. Saturated soils were encountered at approximately 11 feet bgs in the boring for LF5GW103 to 26 feet bgs in the soil boring for LF5GW102.

Well LF5GW102 is located near the southern boundary of the excavated area (Figure A-9-1). Wells LF5GW103 and LF5GW104 are located within the excavated portion of former FS 5 along the western border. In addition, previously existing well 1349MW03, which was located within the footprint of the FS 5 fill material, was abandoned prior to remedial excavation activities and was replaced with well 1349MW03R. The new location was approximately 60 feet south, further within the footprint of the excavated area, in close proximity to an inferred fault (Figure A-9-1). These wells are generally screened within the Franciscan complex serpentinite, as are wells 1349MW100 and 1349MW101.

Surface and groundwater at FS 5 flows in a southwesterly direction towards Baker Beach in the Coastal Bluffs Groundwater Basin. Depth to groundwater beneath FS 5 ranges from 5 to 33 feet bgs (Table A-9-8). All of the wells at FS 5 and monitoring wells 1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102 are located in the Coastal Bluffs Groundwater Basin.

Additionally, groundwater elevation measurements from wells 1349MW103 through 1349MW105 indicate that groundwater in this area flows northeasterly to northwesterly within the Marina Groundwater Basin. Monitoring wells 1349MW103 through 1349MW105 are discussed in Section A-5 and will not be discussed further in this section.

3.0 REMEDIAL ACTION

The *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5* (RAP) was prepared and approved during Third Quarter 2002 (Treadwell & Rollo, 2002e). The RAP selected excavation, recycling, and offsite disposal of all fill material and impacted underlying soils, along with groundwater monitoring, as the FS 5 remedial alternative. Under the remedial alternative, all fill material and contaminated soil with constituent concentrations above the cleanup criteria was removed and disposed of offsite at an approved disposal facility. The removal action at FS 5 began in February 2003 and was completed in September 2004.

Additional soil sampling to complete the soil cleanup activities at FS 5 has been completed and documented in the *Draft Construction Completion Report Landfill 4 and Fill Site 5* (CCR) which was submitted for stakeholder review in the Fourth Quarter 2004 (Treadwell & Rollo, 2004e). Between 7 February and 25 April 2003, a total of 12,393 tons of waste material was removed from the former FS 5 site, with an approximate additional 40 cubic yards of Class II waste removed in September 2004. Approximately 90 percent of the fill material was disposed at Class II and Class III disposal sites and the remainder as Class I California Hazardous Waste. Soil confirmation sample concentrations or 95% UCL calculations for all compounds tested (both COC and non-COC compounds) determine that the site soil conditions meet the goals presented in the RAP and that the site is suitable for unrestricted use. Based on the remedial activities conducted, field observations, established cleanup levels, and a review and evaluation of the confirmation sampling results, LF 4 and FS 5 are recommended for construction completion. The sites are available for unrestricted use. Groundwater monitoring will continue per the RAP for three years to confirm that applicable cleanup levels are not exceeded (Treadwell & Rollo, 2002f).

During remedial activities at FS 5, an underground storage tank (UST) was discovered, removed, and off-hauled (Figure A-9-1). The details of the UST removal can be found in the *Draft Underground Storage Tank Closure Report Former Building 1351*, which is included as an appendix to the *Draft Construction Completion Report Landfill 4 And Fill Site 5*, (Treadwell & Rollo, 2003e). Soil confirmation sample concentrations and/or 95% UCL calculations for compounds tested (both COC and non-COC compounds) indicated that the site conditions meet the goals presented in the RAP.

Based on discussions with DTSC on 19 February 2004 and the Trust's letter to DTSC regarding *Landfill 4 and Fill Site 5 Exceedance Follow-up* dated 17 May 2004, the Trust performed additional sampling at Fill Site 5 on 8 July 2004. The purpose of the additional sampling was to confirm the zinc cleanup level exceedance in the duplicate sample DUP031003A. Sample DUP031003A was collected at a depth of 0.5 feet adjacent to sample FS5EX112[0.5] and had a zinc exceedance as well as detectable levels of cadmium and silver. The previous FS5EX112[0.5] sample location was located using the Trust's Trimble GPS unit. Additional confirmation samples (FS5EX162) were collected at 0.5-, 1-, 1.5- and 2-foot depths. Confirmation sample results for FS5EX162[0.5] and duplicate sample DUP070804B (collected at 1-foot bgs), exceeded the cleanup level of 160 µg/kg.

Additional excavation was completed at sample location FS5EX162. This area was excavated to a depth of 1 foot bgs on 1 September 2004 and confirmation soil samples were collected on 2 September 2004 and submitted for zinc analysis. The additional confirmation sample results were all below the zinc cleanup level of 160 mg/kg indicating that the site is available for unrestricted land use. The results of this sampling are detailed in the CCR (Treadwell & Rollo, 2004e).

Between 9 and 23 April 2003, approximately 5,604 cubic yards of imported backfill material (Letterman Colma Backfill Soil) was delivered to the site. The source for the FS 5 imported material was the Letterman redevelopment project Colma excavation spoils.

In accordance with the California Code of Regulations, Title 27, Subchapter 3, Section 20390, a site that has undergone clean closure (where all wastes, residues, contaminated subsoil, and other contaminated materials are removed or decontaminated at closure) must be shown to comply with the water quality protection standard or the cleanup levels presented in Section 3 of the RAP for three years. A complete table of cleanup levels for compounds in groundwater applicable to the FS 5 monitoring wells is presented in Table 3-11 of the RAP and is included in this section.

Following the removal action, four new monitoring wells (1349MW03R and LF5GW102 through LF5GW104) were installed and added to this groundwater monitoring program at locations shown on Figure A-9-1. The new FS 5 wells were first sampled in the Second Quarter 2003 and will be sampled quarterly for a minimum of three years in accordance with the RAP.

During Phase 1 of the Building 1349 SI (Treadwell & Rollo, 2003d), monitoring well 1349MW100 was installed upgradient of FS 5. Phase 2 of the Building 1349 SI occurred during the FS 5 excavation activities and wells 1349MW101 and 1349MW102 were installed at the upgradient edge of the former FS 5 footprint to provide upgradient groundwater elevation and chemistry information for FS 5 and therefore, the cleanup levels specified in the RAP apply to wells 1349MW101 and 1349MW102.

Building 1349 monitoring wells 1349MW01, 1349MW02 and 1349MW100 are not located within, but are upgradient of the former FS 5 footprint. Therefore, the cleanup levels specified in the RAP do not apply to monitoring wells 1349MW01, 1349MW02 and 1349MW100.

Treadwell & Rollo sampled the imported Letterman Colma Backfill Soil (Colma Fill) at Fill Site 5 for OCPs in accordance with the *Field Sampling Plan to Evaluate Possible Chlordane in Letterman Colma Backfill Soil* dated 28 February 2006. The purpose of the soil sampling was to characterize the Colma Fill at Fill Site 5 for the occurrence of chlordane above site specific soil cleanup levels. The analytical results of this sampling are currently pending.

4.0 GROUNDWATER MONITORING

FS 5 has five monitoring wells (LF5GW100 through LF5GW104) and the Building 1349 Area has six monitoring wells (1349MW01, 1349MW02, 1349MW03R and 1349MW100 through 1349MW102) associated with the FS 5 groundwater monitoring plan (Figure A-9-1). Groundwater elevations were collected at all FS 5 and associated Building 1349 Area wells during the First and Second Quarters 2006.

During the First Quarter 2006, groundwater samples were collected from all FS 5 and associated Building 1349 Area monitoring wells and FS 5 seep location LF5SP100, in accordance with Table 1A. During the Second Quarter 2006, groundwater samples were collected from monitoring well1349MW100, in accordance with Table 1B.

FS 5 seep location LF5SP100 was not flowing on 22 May 2006 at the time of water level measurements. Building 1349 Area monitoring well results are also discussed in Appendix A-5.

4.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected on 6 March and 22 May 2006. Groundwater elevations are recorded in Table A-9-8. Water level meters were calibrated on 6 March and 22 May 2006 and the calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the First Quarter 2006, the groundwater elevations ranged from 223.47 to 287.04 feet above PLLW in monitoring wells LF5GW100 and 1349MW101, respectively (Figure A-9-1). Several monitoring wells (LF5GW102 through LF5GW104, 1349MW01, 1349MW02, 1349MW03R, 1349MW100, and 1349MW102 through 1349MW105) had new high groundwater elevations measured during the First Quarter 2006. During the Second Quarter 2006, groundwater elevations ranged from 221.20 to 292.12 in monitoring wells LF5GW100 and 1349MW101, respectively (Figure A-9-2). Several monitoring wells (LF5GW102, LF5GW103, 1349MW01, 1349MW02, 1349MW03R, and 1349MW100 through 1349MW105) had new high groundwater elevations measured during the Second Quarter 2006. The new high groundwater elevations during the First and Second Quarters 2006 can likely be attributed to the large amount of rainfall received throughout the winter.

Groundwater elevation maps showing the First and Second Quarter 2006 groundwater contours and flow direction for FS 5 are included as Figures A-9-1 and A-9-2, respectively. During both quarters, groundwater flow was in a southwesterly direction, following the general topographic trend. During the First and Second Quarter 2006, the groundwater gradient was estimated to be approximately 0.10 and 0.11 feet per foot, respectively. Groundwater flow directions and gradients are consistent with those previously found at the site.

4.2 Monitoring Well Purging and Sampling

During the First and Second Quarters 2006, the FS 5 monitoring wells and associated Building 1349 Area monitoring wells scheduled for sampling were purged and sampled using methods shown in Tables 1A and 1B, in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a). During the Second Quarter 2006, only 1349MW100 and 1349MW102 were scheduled for sampling.

Purge equipment, purging volumes, purge water general chemistry parameters, and sampling equipment for each monitoring well are described in the purge records located at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

4.3 Groundwater Analytical Program

All groundwater samples collected were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are described in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed this quarter.

5.0 GROUNDWATER ANALYTICAL RESULTS

The groundwater samples collected from FS 5 monitoring wells during the First Quarter 2006 were analyzed for general chemistry, TDS, OCPs, VOCs, PAHs, PCBs, TPHg, TPHd, TPHfo, and 23 dissolved metals. Groundwater samples collected from FS 5 associated monitoring well 1349MW100 during the Second Quarter 2006 was analyzed for general chemistry, TDS, OCPs, VOCs, PAHs, TPHg, TPHd, TPHfo, and 23 dissolved metals.

The TPHfo standard currently being used is a TPH as motor oil standard, as defined by the Presidio QAPP, with a carbon range of C_{24} to C_{36}. Section 5.4.3.1 in the main text discusses the data compatibility issues associated with TPH analyses.

Hexavalent chromium analysis was removed from the FS 5 groundwater monitoring schedule beginning with the Second Quarter 2003. Chromium primarily exists in three valence states in nature; chromium(0), trivalent chromium, and hexavalent chromium. Hexavalent chromium is more soluble than both chromium(0) and trivalent chromium and, therefore, the majority of dissolved chromium likely consists of hexavalent chromium.

Reduction to semi-annual sampling for VOCs and PAHs within FS 5 monitoring wells (LF5GW100 through LF5GW104) was approved in the Fourth Quarter 2004. This approval was granted because no RAP-specified cleanup levels have been exceeded in at least four quarters for any of these compounds within any FS 5 monitoring well samples. In addition, TPH, PAHs, VOCs, PCBs, chlorinated herbicides, general chemistry parameters, TDS, and dissolved metals met the post-remediation groundwater monitoring requirements and cleanup levels from the FS 5 RAP at 1349MW03R, 1349MW101, and 1349MW102 in the First Quarter 2006. Subsequently, the Trust requested cessation of these analytical compounds from the Groundwater Monitoring Program at FS 5/Building 1349 (including 1349MW03R, 1349MW101, and 1349MW102), prior to the Second Quarter 2006. These three wells will however be monitored in the future under the Building 1349 Area CAP upon its finalization.

5.1 Dissolved Oxygen

Dissolved oxygen results are presented in Table A-9-1. Dissolved oxygen concentrations measured during the First Quarter 2006 in monitoring wells associated with FS 5 ranged from 0.15 mg/L in well 1349MW102 to 8.15 mg/L in seep LF5SP100. The dissolved oxygen concentrations within 1349MW102 and seep LF5SP100 are new low and high concentrations. As part of low flow sampling techniques and as recommended in the *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, June 2006), ORP, pH, and temperature were measured, and data are summarized in Table A-9-1.

The dissolved oxygen concentration within well 1349MW100 was 1.1 mg/L during the Second Quarter 2006.

The majority of dissolved oxygen concentrations measured during the First and Second Quarters 2006 were within the range of concentrations previously measured within FS 5 monitoring wells.

5.2 General Chemistry Results

General chemistry results are presented in Table A-9-1. Several FS 5 and associated Building 1349 Area wells had new high and/or low concentrations of general chemistry parameters during the First and Second Quarters 2006. However, these detections are typically only slightly higher or lower than the historical minimum or maximum, and can generally be attributed to natural fluctuations.

The table below summarizes new high and low general chemistry analytical results for the First and Second Quarters 2006 within the FS 5 and associated Building 1349 Area monitoring wells when compared to historical data, and provides the range and frequency of historical results.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
1349MW03R	Alkalinity, Total	11 / 11	330	390	--	440	mg/L
	Bicarbonate	11 / 11	330	390	--	440	mg/L
1349MW100	Chloride	16 / 16	810	1,500	760	--	mg/L
	Sulfate	12 / 16	< 0.5	37	--	65	mg/L
1349MW101	Chloride	10 / 10	190	300	180	--	mg/L
1349MW102	N as Nitrite	1 / 23	< 0.05 *	< 0.1 *	--	0.025	mg/L
	Sulfate	23 / 23	18 *	95	--	156	mg/L
LF5SP100	Alkalinity, Total	5 / 5	55	88	--	110	mg/L
	Bicarbonate	5 / 5	55	88	--	110	mg/L
	Nitrate	5 / 5	0.34	1.5 *	0.31	--	mg/L
1349MW01	Sulfate	24 / 24	161	262 *	--	300	mg/L
1349MW104	Dissolved Oxygen	6 / 6	0.32	3	0.08	--	mg/L
	Sulfate	6 / 6	55	67	--	74	mg/L
1349MW105	Alkalinity, Total	6 / 6	230	280	--	300	mg/L
	Bicarbonate	6 / 6	230	280	--	300	mg/L
	Chloride	6 / 6	540	760	450	--	mg/L
	Fluoride	6 / 6	0.33	0.63	0.29	--	mg/L
	Sulfate	6 / 6	130	150	76	--	mg/L
1349MW103	Alkalinity, Total	7 / 7	310	600	--	670	mg/L
	Bicarbonate	7 / 7	310	600	--	670	mg/L
	Chloride	7 / 7	790	830	--	930	mg/L
	Fluoride	7 / 7	0.31	0.66	0.29	--	mg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the general chemistry parameters measured during the First and Second Quarters 2006 are within historical ranges. Significant new high and low general chemistry results are discussed below.

- Nitrite was detected at a new high concentration of 0.025 mg/L in the QA/QC sample from 1349MW102 during the First Quarter 2006. This is the first time nitrite has been detected within this well.

General chemistry parameters within FS 5 associated monitoring wells have remained relatively stable. The concentration fluctuations of general chemistry parameters within these FS 5 associated Building 1349 Area monitoring wells can likely be attributed to natural concentration fluctuations, and are not considered to be significant. However, increasing and decreasing trends, as well as the potential for new increasing or decreasing trends at the site will continue to be evaluated in future monitoring events.

5.3 TPH Results

TPH results are presented in Table A-9-2 and illustrated on Figure A-9-3. The table below summarizes new high and low TPH concentration for the First and Second Quarters 2006 within the FS 5 and associated Building 1349 Area monitoring wells when compared to historical data, and provides the range and frequency of historical results. Detected TPH compounds are discussed below.

The table below summarizes new high and low TPH analytical results for the First and Second Quarters 2006 within the FS 5 and associated Building 1349 Area monitoring wells when compared to historical data, and provides the range and frequency of historical results.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Total Petroleum Hydrocarbons							
LF5GW101	TPH As Diesel C12-C24	1 / 18	< 50	< 50	--	51 *	µg/L
LF5GW102	TPH As Diesel C12-C24	2 / 15	< 48	51 *	--	61 *	µg/L
LF5GW104	TPH As Diesel C12-C24	1 / 12	< 50	< 50	--	50 *	µg/L
1349MW01	TPH As Diesel C12-C24	2 / 29	< 50	57 *	--	79 *	µg/L
1349MW102	TPH As Diesel C12-C24	1 / 1	< 50	54	--	60 *	µg/L
1349MW104	TPH As Diesel C12-C24	1 / 6	< 50	< 50	--	55 *	µg/L
1349MW103	TPH As Diesel C12-C24	1 / 7	< 50	< 50	--	54 *	µg/L

Qualified data in the table above is indicated with an asterisk (*).

During the First Quarter 2006, TPHd was detected in FS 5 monitoring well LF5GW100 and the FS 5 associated monitoring well 1349MW102 duplicate sample at concentrations 52 µg/L and 60 µg/L, respectively. TPHd was detected in FS 5 monitoring wells LF5GW101 and LF5GW104 duplicate sample at qualified concentrations of 51 µg/L and 50 µg/L, respectively. This is the first time TPHd has been detected in either of these wells. TPHd was detected at new high concentrations within FS 5 monitoring well LF5GW102 and associated FS 5 monitoring well 1349MW01 at concentrations of 61 µg/L and 79 µg/L, respectively. All of these detections are well below the Fill Site 5 RAP-specified cleanup level of 880 µg/L. TPHg and TPHd were detected in FS 5 associated monitoring well 1349MW100 at concentrations of 1,300 and 6,900 µg/L, respectively.

During the Second Quarter 2006, TPHg was detected in the primary, duplicate and QC samples from 1349MW100 at concentrations of 690, 490, and 350 µg/L, respectively. TPHd was detected in the primary, duplicate and QC samples from 1349MW100 at concentrations of 3,600, 5,200, and 5,400, respectively. Fill Site 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

No other TPH compounds were detected within any FS 5 associated monitoring wells. TPH concentrations at FS 5 have previously been non-detect with some isolated detections which were well below RAP cleanup levels. TPHg and TPHd concentrations within 1349MW100 at Building 1349 continue to fluctuate. The potential for increasing or decreasing TPH concentration trends at the site will continue to be evaluated in future monitoring events.

5.4 VOC Results

Results of VOC analyses are presented in Table A-9-3. No VOCs were detected at or above the laboratory detection limit in any FS 5 monitoring well samples during the First Quarter 2006. No VOCs were scheduled for analysis within FS 5 monitoring wells during the Second Quarter 2006. No VOCs have been detected within FS 5 monitoring wells since sampling began in July 2000. VOC detections at FS 5 associated Building 1349 Area monitoring wells are discussed below.

Benzene was detected within monitoring well 1349MW100 during the First Quarter 2006 at a concentration of 22 µg/L, and in the Second Quarter 2006 primary, duplicate, and QC samples at concentrations of 29, 28, and 30 µg/L, respectively. These concentrations exceed the Building 1349 Area cleanup level for benzene of 1 µg/L. Carbon disulfide was not detected within monitoring well 1349MW100 during the First Quarter 2006, but was detected in the primary and duplicate samples from monitoring well 1349MW100 during the Second Quarter 2006 at concentrations of 0.7 and 0.8 µg/L, respectively. This is the first detection of carbon disulfide since Second Quarter 2003. Ethylbenzene and total xylenes were both detected within monitoring well 1349MW100 during the First Quarter 2006 at a concentration of 0.8 µg/L. Ethylbenzene was detected within monitoring well 1349MW100 during the Second Quarter 2006 in the primary and duplicate samples at a concentration of 0.8 µg/L, and in the QC sample at a concentration 0.9 µg/L. Total xylenes were detected within monitoring well 1349MW100 during the Second Quarter 2006 at concentrations of 3.8, 3.7, and 4.2 µg/L in the primary, duplicate, and QC samples, respectively. The detected concentrations of ethylbenzene and total xylenes are well below their respective cleanup levels of 700 µg/L and 318 µg/L.

5.5 OCP and PCB Results

PCBs have not been detected within any FS 5 or associated Building 1349 Area monitoring well samples to date. No OCPs were detected during the First or Second Quarter 2006 in any FS 5 monitoring wells. Results of OCP and PCB analyses and FS 5 RAP cleanup levels are presented in Table A-9-4 and beta-BHC and gamma-BHC results are illustrated on Figure A-9-3. OCP detections within FS 5 associated monitoring well 1349MW100 at the Building 1349 Area are discussed below.

Several OCP compounds were detected within upgradient monitoring well 1349MW100 during the First and Second Quarters 2006.

During the First Quarter 2006, alpha-chlordane and gamma chlordane were detected at new high concentrations of 0.9 µg/L and 0.7 µg/L, respectively. 4,4'-DDD (0.9 µg/L), aldrin (0.3 µg/L), delta-BHC (0.1 µg/L), dieldrin (0.4 µg/L), heptachlor (0.8 µg/L), and heptachlor epoxide (0.2 µg/L) were detected within the range of historical concentrations of these compounds at this well. During the Second Quarter 2006, heptachlor epoxide was detected in the primary sample at a new high concentration of 0.4 µg/L and in the duplicate sample at a concentration of 0.3 µg/L. 4,4'-DDT was detected in the primary and duplicate samples at a concentration of 0.8 µg/L. Aldrin and alpha-chlordane were detected in the duplicate samples at concentrations of 0.3 and 0.8 µg/L, respectively.

The concentrations of dieldrin and heptachlor in the First Quarter 2006, exceeded the FS 5 RAP cleanup levels. However, the FS 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

OCP concentrations continue to be non-detect within FS 5 monitoring wells, but fluctuate within Building 1349 Area monitoring well 1349MW100. The potential for increasing or decreasing OCP concentration trends at FS 5 and Building 1349 Area will continue to be evaluated in future monitoring events.

5.6 PAH Results

PAHs were not detected during the First Quarter 2006 within any FS 5 monitoring well samples. PAHs were not scheduled for analysis during the Second Quarter 2006. PAH analytical results and FS 5 RAP cleanup levels are included in Table A-9-5.

Several PAH compounds were detected within upgradient monitoring well 1349MW100 during the First and Second Quarters 2006.

During the First Quarter 2006, acenaphthene (6.6 µg/L), anthracene (0.36 µg/L), benzo(a) anthracene (0.35 µg/L), chrysene (0.29 µg/L), fluoranthene (2.3 µg/L), fluorene (2.3 µg/L), phenanthrene (9 µg/L), and pyrene (0.75 µg/L) were detected at concentrations within the range of historical concentrations of these compounds at this well. During the Second Quarter 2006 in the primary, duplicate and QC samples, acenaphthene was detected at concentrations of 3.6, 4.3, and 5.6 µg/L, respectively. Anthracene was detected at concentrations of 0.2, 0.28, and 0.24 µg/L, respectively. Benzo(a) anthracene was detected at concentrations of 0.11, 0.14, and 0.48 µg/L, respectively. Fluoranthene was detected at concentrations of 1.6, 1.8, and 0.38 µg/L, respectively. Fluorene was detected at concentrations of 7.5, 8.4, and 4.0 µg/L, phenanthrene was detected at concentrations of 4.9, 5.8, and 3.5 µg/L, respectively, and pyrene was detected at concentrations of 0.38, 0.48, and 0.44 µg/L. These detected concentrations were within the range of historical concentrations within this well. PAHs were not detected in any of the other FS 5 or Building 1349 Area samples during the First or Second Quarters 2006.

The concentrations of benzo(a)anthracene in the First and Second Quarters 2006, exceeded the cleanup levels taken from the FS 5 RAP for FS 5 monitoring wells. However, the FS 5 RAP-specified cleanup levels do not apply to monitoring well 1349MW100. Cleanup levels and exceedances associated with 1349MW100 are discussed in Section A-5.

5.7 Dissolved Metals Results

Dissolved metal concentrations detected within FS 5 and associated Building 1349 Area groundwater samples during the First and Second Quarters 2006 were generally within the range of concentrations previously detected. Total and dissolved metals results, along with RAP-specified cleanup levels, are presented in Table A-9-7. Arsenic, chromium, and iron results are also shown on Figure A-9-3. Seep LF5SP100 was analyzed for total and dissolved metals during the First Quarter 2006.

The following table summarizes new high and low dissolved metal analytical results for the First and Second Quarters 2006 within the FS 5 and associated Building 1349 Area locations when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Metals, Dissolved							
1349MW03R	Total Dissolved Solids	12 / 12	360	1,980	--	2,060	mg/L
1349MW100	Magnesium	14 / 14	190,000	390,000	180,000 *	--	µg/L
	Selenium	1 / 14	< 5	< 5	--	10	µg/L

	Total Dissolved Solids	7 / 7	1,320	1,650	--	2,220	mg/L
1349MW02	Cadmium	1 / 22	< 1	< 1	--	1.1	µg/L

Qualified data in the table above is indicated with an asterisk (*).

The majority of the dissolved metals concentrations measured during the First and Second Quarters 2006 are within historical ranges. Significant new high and low dissolved and total metals results are discussed below.

- During the First Quarter 2006, dissolved aluminum was detected in the duplicate sample from monitoring well 1349MW102 at a concentration of 260 µg/L and dissolved selenium was detected at a concentration of 2.3 µg/L in the QA sample. Aluminum and selenium have not previously been detected within this well.

- Dissolved cadmium was detected above the laboratory reporting limit at a concentration of 1.1 µg/L within monitoring well 1349MW02 during First Quarter 2006. Cadmium has not been detected within this well in previous sampling events.

- Dissolved chromium was detected in monitoring wells LF5GW101 and 1349MW03R during the First Quarter 2006 at concentrations of 53 and 120 µg/L, respectively. Chromium concentrations within 1349MW03R have exceeded the FS 5 RAP cleanup level of 50 µg/L since the Fourth Quarter 2004.

- Dissolved mercury, nickel, and selenium were detected at concentrations of 0.625, 4.8, and 2.9 µg/L in the QA sample from monitoring well LF5GW104 during the First Quarter 2006. The mercury detection exceeds the FS 5 RAP cleanup level of 0.012 µg/L. None of these metals have been detected within this well in previous sampling events.

- Dissolved selenium was detected in monitoring well 1349MW100 at a concentration of 10 µg/L, during First Quarter 2006. Monitoring well 1349MW100 is located upgradient of FS 5 and therefore, FS 5 RAP cleanup levels do not apply.

Dissolved chromium continues to exceed the FS 5 RAP cleanup levels within monitoring wells LF5GW101 and 1349MW03R. The FS 5 and associated Building 1349 Area monitoring wells are all screened in serpentinite with the exception of 1349MW01 which is screened in mélange containing serpentinite fragments. Based on the *Technical Memorandum Regarding the Hexavalent Chromium in Serpentinite Bedrock and Groundwater in Upland Areas* (Montgomery Watson, 1999o) and the *Memorandum Regarding the Natural Occurrence of Hexavalent Chromium in Surface Water and Groundwater at the Presidio of San Francisco, California* (EKI, 2000c), hexavalent chromium and dissolved chromium in groundwater in upland areas of the Presidio appear to be naturally occurring and derived from serpentinite. FS 5 and the associated Building 1349 Area are underlain by greenstone and serpentinite. There is no known anthropogenic chromium source associated with Building 1349 which lies upgradient of FS 5. Chromium was not a soil COC at FS 5. Thus, hexavalent chromium and dissolved chromium appear to be naturally occurring and are not considered COCs in groundwater at FS 5.

The dissolved aluminum and selenium detections within monitoring well 1349MW102, dissolved cadmium within monitoring well 1349MW02, and the dissolved mercury, nickel, and selenium detections within monitoring well LF5GW104 in the First Quarter 2006 are first time occurrences and do not yet represent a trend. Additional sampling for these analytes is required during future sampling events to determine whether these results are anomalous.

- Total barium, calcium, cobalt, lead, magnesium, manganese, mercury, nickel, thallium, vanadium, and zinc were all detected at new high concentrations in the First Quarter 2006 LF5SP100 seep sample. Copper was detected at a new low concentration in the First Quarter 2006 LF5SP100 seep sample.

In general, dissolved and total metals concentrations within the site have remained relatively stable, though clear trends are not yet apparent for seep LF5SP100, where only three sampling events have occurred and results continue to fluctuate. The potential for increasing or decreasing metals concentration trends at the site will continue to be evaluated in future monitoring events.

6.0 CONCLUSIONS & RECOMMENDATIONS

No PCBs were detected above their respective RAP-specified cleanup levels within any FS 5 or associated Building 1349 Area monitoring wells during the First or Second Quarters 2006.

Several OCP, PAH, and TPH compounds were detected in the upgradient Building 1349 monitoring well 1349MW100 samples during the First and Second Quarters 2006. FS 5 RAP cleanup levels do not apply to upgradient Building 1349 monitoring wells.

Per the FS 5 RAP, the reduction to semi-annual sampling for VOCs and PAHs within FS 5 monitoring wells (LF5GW100 through LF5GW104) was approved in the Fourth Quarter 2004 because no RAP-specified cleanup levels have been exceeded in at least four quarters for any of these compounds within any FS 5 monitoring well samples. In addition, TPH, PAHs, VOCs, PCBs, chlorinated herbicides, general chemistry parameters, TDS, and dissolved metals met the post-remediation groundwater monitoring requirements and cleanup levels from the FS 5 RAP within 1349MW03R, 1349MW101, and 1349MW102 in the First Quarter 2006. Subsequently, the Trust requested cessation of these analytical compounds from the Groundwater Monitoring Program at FS 5/Building 1349 (including 1349MW03R, 1349MW101, and 1349MW102), prior to the Second Quarter 2006. These three wells will however be monitored in the future under the Building 1349 Area CAP upon its finalization.

Notes
a Residential cleanup levels do not apply to this site; they are included only for reference.
Italics indicate compounds for which the cleanup level is below the laboratory detection limit and the detection limit therefore serves as the cleanup level.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - The QC laboratory nitrate results shown have been converted to nitrate as nitrogen (nitrate-N) as other laboratory results are reported. The QC laboratory reported nitrate as NO_3 concentrations (nitrate-NO_3) which are 4.43 times higher than nitrate-N concentrations.
mg/L - milligrams per liter
NA - not analyzed
NM - not measured
"--" dissolved oxygen measurements were not taken for duplicate and quality control samples.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
ORP - Oxidation Reduction Potential
mV - millivolts
°C - degrees centigrade

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.
3 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2003e).
4 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 are located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.
µg/L - micrograms per liter
NA - not analyzed
TPH - total petroleum hydrocarbons
Bold numbers indicate concentrations which exceed cleanup criteria.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).
3 - Monitoring wells 1349MW01, 1349MW02 and 1349MW100 are located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.
-- - cleanup level not established
µg/L - micrograms per liter
ND - not detected
NA - not analyzed
1,2-DCA - 1,2-dichloroethane
VOCs - volatile organic compounds
MTBE - methyl tert-butyl ether
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Bold numbers indicate concentrations which exceed cleanup criteria.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).
3 - The RAP does not list a cleanup level for beta-BHC; however, the RAP states that when chemicals are encountered in groundwater and cleanup levels are not listed, the default should be Tap Water PRGs.
The Tap Water PRG for beta-BHC (HCH-beta) is 0.037 µg/L.
4 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 are located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.
-- - cleanup level not established
µg/L - micrograms per liter
ND - not detected
NA - not analyzed
- The continuing calibration verification (CCV) drifted outside the limits although the average CCV drift was within method requirements.
OCPs - organochlorine pesticides
PCBs - polychlorinated biphenyls
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Bold numbers indicate detected concentrations which exceed cleanup criteria.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.

2 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2002e).

3 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 is located upgradient of Fill Site 5, therefore, the cleanup levels do not apply to these wells.
-- - cleanup level not established
Bold numbers indicate concentrations which exceed cleanup criteria.
µg/L - micrograms per liter
ND - not detected
NA - not analyzed
PAHs - polycyclic aromatic hydrocarbons
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
All metal results represent dissolved metals, unless indicated as "total" in the left-hand column, for total metal results. RAP cleanup levels only apply to dissolved metals concentrations or whatever has been used on other metals tables.
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - Results of Army and Trust studies support the hypothesis that dissolved chromium and hexavalent chromium measured in groundwater in upland areas of the Presidio appear to be naturally occurring and derived from serpentinite.
Hexavalent chromium was not retained as a COC (Treadwell and Rollo, 2002e).
3 - Groundwater cleanup levels were taken from the *Remedial Action Plan and Evaluation of Alternatives for Landfill 4 and Fill Site 5, Presidio of San Francisco, California* (Treadwell & Rollo, 2003e).
4 - Monitoring wells 1349MW01, 1349MW02, and 1349MW100 are located upgradient of Fill Site 5, therefore, the Fill Site 5 cleanup levels do not apply to these wells.
Surface water seep sample LF5SP100 is analyzed for total metals rather than dissolved, in accordance with the approved plan.
Groundwater samples collected from monitoring wells 1349MW03R through LF5GW104 were field filtered and analyzed for dissolved metals.
Bold numbers indicate concentrations which exceed cleanup criteria.
-- - Cleanup criteria not established
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and associates them with the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

BUILDING 231/207 AREA
APPENDIX SECTION A-10
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 231/207 Area is located in the northeast portion of the Presidio (Figure 1). The site elevation ranges from approximately 10 to 30 feet above PLLW datum.

Building 231 was built in 1950 and operated as an automobile service station for privately owned vehicles (Figure A-10-1). Building 231 was in operation until mid-1995 as an auto shop and tire store that performed a variety of automobile services. Building 228, located within the Building 231/207 Area, operated as a dry cleaner for an unknown period of time between 1950 and 1973 (Dames and Moore, 1995). Building 207 was the exchange service station and has a history of oil, fuel and gasoline station use (Harding ESE, 2003).

Samples have been collected from wells at the Building 231/207 Area since July 1993 and have been analyzed for general chemistry parameters, TPH, VOCs, and 23 dissolved metals. Groundwater samples were collected at some well locations prior to 1993, and the analytical data for that work is available in the RI Report (Dames & Moore, 1997). A summary of analytical results can be found in Tables A-10-1 through A-10-3 in this section.

The *Draft Building 231/207 Area Corrective Action Plan* (CAP) (MACTEC, 2005c), which documents the evaluation and selection of cleanup alternatives for soil and groundwater contamination at the site has recently been prepared. The CAP is discussed in greater detail in Section 3.0.

The well box elevations of monitoring wells and piezometers 231GW21, 231GW22, 231PZ03, and 231PZ04 were surveyed as part of the Data Gaps Investigation (MACTEC, 2004). The survey results presented in Table C.1 of the Data Gaps Investigation Report were subsequently determined to be incorrect due to a surveying error. The top of casing elevations presented in this report were not affected by this surveying error and are correct.

To evaluate changing redox conditions, pH, temperature and ORP were added to the program in the First Quarter 2006. The *Technical Memorandum, Evaluation of Arsenic and Other Metals in Groundwater at Three Corrective Action Plan Sites, Presidio of San Francisco, San Francisco, California* (MACTEC, 2006), concluded that ORP is a good indicator for evaluating changing redox conditions. The First Quarter 2006 pH, temperature and ORP data are presented in Table A-10-1 and will be used in the ongoing redox evaluations at CAP sites.

2.0 SITE DESCRIPTION AND GEOLOGY

The Building 231/207 Area is in the northeast portion of the Presidio on the border of the Northeastern and Crissy Field Groundwater Areas, both located within the Marina Groundwater Basin (Figure 1). Subsurface materials beneath the Building 231/207 Area consist of artificial debris fill, fine-grained estuarine deposits, and sand deposits. Groundwater studies conducted in the Building 231/207 Area identified three distinct water-bearing zones, designated as the shallow, intermediate, and deep zones. These three sandy water-bearing zones are separated by two less permeable clayey fine grained estuarine deposits (Harding ESE, 2003). The shallow zone exhibits unconfined conditions and extends to approximately 15 feet bgs. The intermediate zone is semi-confined and extends from approximately 15 to 25 feet bgs. The deep, confined zone extends from approximately 25 to 85 feet bgs. Groundwater has been reported to flow northward towards the San Francisco Bay (Montgomery Watson, 1997a).

3.0 BUILDING 207/231 AREA CAP

The CAP (Mactec, 2005c) was submitted to all stakeholders for public review on 15 July 2005. The following chemicals were identified by the CAP as chemicals of concern in soil; TPHg, TPHd, TPHfo, VOCs (BTEX, MTBE, PCE, TCE, bromobenzene, vinyl chloride, and methylene chloride), PAHs (acenaphthylene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(b+k)fluoranthene, benzo(k)fluoranthene, chrysene, fluoranthene, phenanthrene, and pyrene), metals (arsenic, chromium, cobalt, lead, mercury, nickel, silver, and zinc), and pesticides (4,4'-DDD) and PCBs (Arochlor 1016). Additionally, the following chemicals were identified by the CAP as chemicals of concern in groundwater; TPHg, TPHd, TPHfo, VOCs (BTEX, MTBE, bromobenzene, 1,2-DCA, PCE, TCE, and vinyl chloride), PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(b+k)fluoranthene, benzo(k)fluoranthene, and chrysene, and indeno(1,2,3-cd)pyrene), metals (arsenic, lead, nickel, vanadium, and zinc), and PCBs (Arochlor 1016).

Based on cleanup level exceedances, five remedial units (RUs or areas of contamination exceeding cleanup levels) were identified, comprising seven areas of petroleum-related soil contamination and four areas of groundwater contamination.

The CAP recommends *Excavation and Offsite Disposal of Soil, and Groundwater Monitoring* as the preferred corrective action alternative for all RUs except the Historic Building 228 Area. The CAP recommends *Capping, Land Use Controls, In Situ Groundwater Treatment, and Groundwater Monitoring* as the preferred corrective action alternative for Historic Building 228 Area. This corrective action will be implemented by summer 2007, as detailed in the CAP (Mactec, 2005c).

Groundwater sampling at the Building 207/231 Area will be conducted in accordance with the CAP following CAP approval and implementation. Cleanup levels proposed in the CAP are presented in Tables A-10-2, A-10-3 and A-10-6.

4.0 GROUNDWATER MONITORING

The Building 231/207 Area groundwater monitoring program includes 27 monitoring wells and piezometers (Figure A-10-1). The monitoring wells associated with the Building 231/207 Area are screened within three distinct water-bearing units designated as the shallow, intermediate, and deep zones. During the First and Second Quarters 2006, groundwater elevation measurements were collected at all 27 wells and piezometers.

Twenty-six Building 231/207 Area monitoring wells were sampled during the First Quarter 2006, in accordance with Table 1A. Only one monitoring well (231GW09) was proposed for sampling at the Building 231/207 Area during the Second Quarter 2006 (Table 1B). This well was sampled as part of the Fill Site 6 monitoring program described in Appendix A, Section A-3. Monitoring well OW-1 was not proposed for sampling during either the First or Second Quarters 2006.

5.1 Groundwater-Level Measurements and Interpretation

Groundwater elevation measurements were collected at all site wells and piezometers for the First Quarter on 6 March 2006 and for the Second Quarter on 22 May 2006. Groundwater elevations are presented in Table A-10-7. Water-level meters were calibrated on 6 March and 22 May 2006. The calibration logs can be found in Appendix B. Groundwater elevation field forms can be found in Appendix C.

During the First and Second Quarters 2006, the shallow, intermediate, and deep groundwater elevations measured within Building 231/207 monitoring wells were generally within the range of historical elevations measured at the site. The overall groundwater flow direction and gradients associated with the Building 231/207 Area are consistent with previous events.

5.1.1 Shallow Groundwater

During the First Quarter 2006, shallow zone groundwater elevations ranged from 5.27 to 11.68 feet above PLLW in monitoring wells 231GW16 and 231GW09, respectively (Figure A-10-2). During the Second Quarter 2006, shallow zone groundwater elevations ranged from 5.12 to 11.48 feet above PLLW in monitoring wells 231GW16 and 231GW09, respectively (Figure A-10-3). Groundwater elevation measurements at the Building 231/207 Area shallow monitoring wells were evaluated with measurements collected at Building 1065/1027 and Fill Site 6 shallow monitoring wells to better understand groundwater flow direction and gradients in

this area. Groundwater elevation data for these adjacent sites can be found in Tables A-11-7 and A-3-6.

During the First and Second Quarters 2006, the shallow aquifer groundwater flow direction in the Building 231/207 Area was north-northwest towards the San Francisco Bay following the general topography (Figures A-10-2 and A-10-3). During the First and Second Quarters 2006, the shallow groundwater gradient in the vicinity of Building 231 was calculated to be approximately 0.011 and 0.010 feet per foot, respectively. Groundwater gradients and flow directions remain consistent with previous findings at the site.

5.1.2 Intermediate Groundwater

During the First Quarter 2006, intermediate zone groundwater elevations ranged from 6.53 to 10.35 feet above PLLW in monitoring wells 207GW03 and 231GW27, respectively (Figure A-10-4). During the Second Quarter 2006, intermediate zone groundwater elevations ranged from 6.50 to 10.60 feet above PLLW in monitoring wells 207GW03 and 231GW18, respectively (Figure A-10-5).

Groundwater elevation measurements at the Building 231/207 intermediate aquifer monitoring wells were evaluated with Building 1065/1027 intermediate aquifer monitoring wells to better understand groundwater flow direction and gradient in the intermediate aquifer. These groundwater level data can be found in Table A-11-7. During the First and Second Quarters 2006, the intermediate aquifer groundwater flow direction in the Building 231/207 and Building 1065/1027 Areas was generally north-northwesterly, towards the San Francisco Bay following the general topography (Figures A-10-4 and A-10-5). However, a slight depression in the potentiometric surface was present east of Building 231. During the First and Second Quarters 2006, the average intermediate groundwater gradient was calculated in the vicinity of Building 231 to be approximately 0.007 feet per foot, during both the First and Second Quarters. Groundwater gradients and flow directions remain consistent with previous findings at the site.

5.1.3 Deep Groundwater

During the First Quarter 2006, deep zone groundwater elevations ranged from 11.52 to 11.65 feet above PLLW in monitoring wells 231GW17 and 231GW20, respectively (Figure A-10-6). During the Second Quarter 2006, deep zone groundwater elevations ranged from 11.53 to 11.68 feet above PLLW in monitoring wells 231GW13 and 231GW17, respectively (Figure A-10-7). Groundwater flow direction in the deep aquifer was north-northwesterly towards San Francisco Bay during the First Quarter 2006 and north-northeasterly during the Second Quarter 2006 (Figures A-10-6 and A-10-7). The groundwater gradient within the deep aquifer was calculated to be approximately 0.0005 feet per foot during the First Quarter 2006 and 0.0006 feet per foot during the Second Quarter 2006. The deep groundwater flow direction has typically ranged from northeasterly to northwesterly since 2001.

5.1.4 Vertical Gradients

Building 231/207 Area vertical gradient estimates are presented in Table A-10-8. Vertical groundwater gradients were calculated for four well clusters, WC-1, WC-2, WC-3, and WC-4 during the First and Second Quarters 2006. Clusters WC-1, WC-2, and WC-3 each have piezometers screened within the three distinct water-bearing zones. Cluster WC-4 has piezometers screened within the shallow and intermediate water-bearing zones. A description of which piezometers are contained in each well cluster can be found in Table A-10-8. Upward vertical gradients were determined to be present between all groundwater zones at all well clusters during the First Quarter 2006. Upward vertical gradients were determined to be present between all groundwater zones at all well clusters, except between the shallow and intermediate zones within WC-4 during the Second Quarter 2006. Both upward and downward vertical gradients have historically been measured in well cluster WC-4.

5.2 Groundwater Purging and Sampling

During the First Quarter 2006, all 26 monitoring wells and piezometers scheduled for sampling during the First Quarter 2006 were purged and sampled between 8 March and 16 March 2006. During the Second Quarter 2006, Building 231/207 monitoring well 231GW09 was the only well scheduled for sampling and it was purged and sampled on 24 May 2006. Monitoring well 231GW09 is sampled to serve as a downgradient well for Fill Site 6A. All purging and sampling was conducted in accordance with methods shown in Tables 1A and 1B and procedures described in the FSP (Treadwell & Rollo, 2001a).

All samples were collected using methods shown in Tables 1A and 1B and in accordance with procedures described in the FSP (Treadwell & Rollo, 2001a).

Purging equipment, purging volumes, purge water parameters, and sampling equipment for each monitoring well are described in the purge records at the conclusion of this section. Purge water was stored for future disposal in one of two 2,800-gallon aboveground polyethylene storage tanks, which are located at the Central Magazine.

5.3 Groundwater Analytical Program

All groundwater samples were submitted to the project laboratory for the analyses shown in Tables 1A and 1B of the main text. The appropriate sampling containers, preservatives, and maximum holding times for each analytical method are shown in Table 5. Sample containers used for each well are described in the purge records located at the conclusion of this section.

QA/QC samples were collected as part of this program. Section 6.2 of the main text discusses the QA/QC sampling and analysis performed for the First and Second Quarters 2006.

6.0 GROUNDWATER ANALYTICAL RESULTS

Groundwater samples collected during the First Quarter 2006 at the Building 231/207 Area were analyzed for general chemistry parameters, TOC, dissolved metals, TDS, dissolved oxygen, VOCs, MTBE, total sulfides, TPHg, TPHd, and TPHfo. Groundwater samples collected during the Second Quarter 2006 at the Building 231/207 Area were analyzed for general chemistry parameters, dissolved metals, TDS, dissolved oxygen, VOCs, MTBE, total sulfides, TPHg, TPHd, and TPHfo. Additionally, redox (pH, ORP and temperature) parameters were measured within wells sampled during the First and Second Quarters 2006.

The TPHfo standard currently being used is a TPHmo standard, as defined by the Presidio QAPP, with a carbon range of C_{24} to C_{36}. Section 5.4.3.1 in the main report discusses the data compatibility issues associated with TPH analyses.

The analytical results associated with Fill Site 6A parameters are presented and discussed in Appendix A, Section A-3. Building 231/207 Area analytical results are presented in Tables A-10-1 through A-10-6. ORP, pH, and temperature were measured in the field and results are presented in Table A-10-1.

6.1 General Chemistry Results

Table A-10-1 summarizes the results of general chemistry analysis within the Building 237/207 Area.

The following table summarizes new high and low general chemistry analytical results for the First and Second Quarters 2006 within the Building 231/207 Area when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
General Chemistry							
207GW03	Sulfide	2 / 2	2.5	2.5	--	3.4 *	mg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and low general chemistry results are discussed below.

Nitrate was not detected above the reporting limit of 0.05 mg/L within 231GW06 or 231GW28, during the First Quarter 2006. The previous low concentrations within 231GW06 and 231GW28 were 0.1 mg/L and 0.46 mg/L, respectively. This is the first time nitrate has not been detected in these wells since sample collection began in 1997. Nitrate was detected at a new low concentration of 1 mg/L within 231GW29 during the First Quarter 2006. The previous low concentration within 231GW28 was 2.5 mg/L. Nitrite was not detected in any groundwater samples analyzed from the Building 231/207 Area during the First or Second Quarters 2006.

Sulfate was detected during the First Quarter 2006 at concentrations significantly lower than previous detections within 231GW28 and 231PZ02.

Sulfide was not detected above the reporting limit of 0.04 mg/L within 231GW11, 231GW28, 231PZ03, and 231PZ04 during the First Quarter 2006. The previous low concentrations within 231GW11, 231GW28, 231PZ03, and 231PZ04 were 0.3 mg/L, 0.05 mg/L, 0.08 mg/L and 0.06 mg/L, respectively.

The remaining new high and low concentrations from the First and Second Quarters 2006 can be attributed to natural fluctuations and are not considered significant. An evaluation of the redox state of site groundwater and associated general chemistry results can be found in Section 7.0.

6.2 Dissolved Oxygen

Table A-10-2 summarizes dissolved oxygen measurements. Dissolved oxygen was measured within historical ranges in the majority of Building 231/207 Area monitoring wells and piezometers during the First Quarter 2006. Dissolved oxygen concentrations measured during the First Quarter 2006 ranged from 0.13 mg/L to 2.41 mg/L in wells 231GW28 and 231GW09, respectively. Dissolved oxygen was detected at a new low concentration of 0.43 mg/L within 231GW27.

Dissolved oxygen was measured within monitoring well 231GW09 at a concentration of 2.6 mg/L during the Second Quarter 2006, which is within the range of previously measured concentrations within this well.

6.3 TPH Results

Table A-10-2 and Figure A-10-8 summarize the TPH results for the Building 237/207 Area during the First and Second Quarters 2006.

The following table summarizes new high and low TPH analytical results for the First and Second Quarters 2006 within the Building 231/207 Area when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date of commencement of sampling, and the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Total Petroleum Hydrocarbons							
231GW21	TPH As Fuel Oil C24-C36	2 / 34	< 300	430	--	5,400	µg/L
	TPH As Fuel Oil C24-C36	2 / 34	< 300 *	430	--	5,400	µg/L
231GW24	TPH As Diesel C12-C24	1 / 23	< 50	< 50	--	55 *	µg/L
231GW28	TPH As Diesel C12-C24	3 / 20	< 50	100 *	--	160 *	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant new high and TPH results are discussed below.

TPHg was detected within 231GW21, 231GW22, and 231PZ01 through 231PZ04. TPHg was detected in the primary, duplicate and QC duplicate samples collected from 231GW21 at concentrations of 3,100, 3,400, and 3,600 µg/L, respectively. TPHg was also detected in the

primary and the duplicate samples collected from 231GW22 at concentrations of 8,400 and 14,000 µg/L, respectively. TPHg concentrations within 231GW21 and 231GW22 continue to fluctuate within historical bounds.

TPHg was detected during the First Quarter 2006 at concentrations of 9,300, 780, 4,000, and 5,300 µg/L within piezometers 231PZ01, 231PZ02, 231PZ03, and 231PZ04, respectively. All concentrations detected within these piezometers are within the historical range.

TPHd was detected within 207GW03, 231GW19, 231GW21, 231GW22, 231GW24, 231GW28, 231GW29, and 231PZ01 through 231PZ04. TPHd was detected at concentrations of 55 µg/L, 65 µg/L, 55 µg/L, 160 µg/L, and 57 µg/L within wells 207GW03, 231GW19, 231GW24, 231GW28, and 231GW29, respectively.

TPHd was detected in the primary, duplicate and QC duplicate samples collected from 231GW21 at concentrations of 330, 1,300, and 1,200 µg/L, respectively. The difference in concentrations between the primary, duplicate and the QC duplicate sample concentrations collected from monitoring well 231GW21 exceeded the QAPP-specified 50% criteria for TPHd. The TPHd concentration detected within the duplicate sample and QC duplicate samples was significantly higher than in the primary sample result. The primary, duplicate and QC duplicate samples were all collected at the same time and there is no clear reason as to why the analytical results vary so drastically for TPHd.

TPHd was also detected in the primary and the duplicate samples collected from 231GW22 at concentrations of 300 µg/L and 330 µg/L, respectively. TPHd concentrations within 231GW21 and 231GW22 continue to fluctuate significantly within historical bounds.

TPHd was detected during the First Quarter 2006 at concentrations of 360, 430, 200, and 350 µg/L within piezometers 231PZ01, 231PZ02, 231PZ03, and 231PZ04, respectively. All detected concentrations within these piezometers are within the range of concentrations previously reported.

TPHfo was detected during the First Quarter 2006 in the duplicate sample collected from 231GW21 at a concentration of 5,400 µg/L. TPHfo was not detected within the primary or the QC duplicate samples collected from this well. The TPHfo detection exceeds the CAP cleanup level of 443 µg/L, and is higher than the only previous TPHfo detection (430 µg/L) within 231GW21 in the First Quarter 2005. The difference in concentrations between the primary, duplicate and the QC duplicate sample concentrations collected from monitoring well 231GW21 exceeded the QAPP-specified 50% criteria for TPHfo. The primary, duplicate and QC duplicate samples were all collected at the same time and there is no clear reason as to why the analytical results vary so drastically for TPHfo.

TPH was not detected in the sample collected from Building 231/207 Area monitoring well 231GW09 during the First or Second Quarters 2006.

In accordance with RWQCB Order No. R2-2003-0080, 2006 TPHg groundwater analytical results and an approximate TPHg freshwater protection zone screening level contour (443 µg/L) are presented on Figure A-10-8.

6.4 VOC, BTEX, and MTBE Results

During the First Quarter 2006, all Building 231/207 Area monitoring wells sampled were for VOCs. Monitoring well 231GW09 was the only Building 231/207 monitoring well proposed for sampling during the Second Quarter 2006. A summary of VOC analytical results is presented in Table A-10-3 and on Figure A-10-8 and is discussed below.

VOCs were detected within the following monitoring wells and piezometers during the First Quarter 2006: 231GW17, 231GW18, 231GW21, 231GW22, 231GW27, 231GW28, and 231PZ01 through 231PZ04.

No VOCs were detected within monitoring well 231GW09 during the Second Quarter 2006.

The following table summarizes new high and low VOC analytical results for the First and Second Quarters 2006 within the Building 231/207 Area when compared to historical data, and provides the range and frequency of historical results. The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and the number of duplicate analyses performed. Only the new high or new low concentrations are shown.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum	
Volatile Organic Compounds							
231GW21	Chloroform	1 / 37	< 0.5	< 120	--	2.7	µg/L
	Chloroform	1 / 37	< 0.5 *	< 120	--	2.7	µg/L
231PZ01	Toluene	14 / 18	< 100	1,700	< 31	--	µg/L
231PZ03	Toluene	12 / 18	< 5	5.8	--	6.9	µg/L
231PZ04	Toluene	11 / 18	< 5	6.1	--	6.4	µg/L

Qualified data in the table above is indicated with an asterisk (*).

Significant VOC results are discussed below.

Chloroform was detected in the QC sample for the first time within 231GW21 at a concentration of 2.7 µg/L. Chloroform was not detected within the primary or duplicate samples collected from 231GW21 during the First Quarter 2006. The difference in concentrations between the primary, duplicate and the QC duplicate sample concentrations collected from monitoring well 231GW21 exceeded the QAPP-specified 50% criteria for chloroform. The primary, duplicate and QC duplicate samples were all collected at the same time and there is no clear reason as to why the analytical results vary for chloroform.

- Benzene, ethylbenzene, toluene, and total xylenes were detected at concentrations lower than recent monitoring events within 231GW21 during the First Quarter 2005. Benzene concentrations detected within the primary, the duplicate and the QC duplicate samples collected from 231GW21 (ranging from 89 to 110 µg/L) all exceed the CAP-specified cleanup level of 1 µg/L. No other VOC concentrations exceeded CAP-specified cleanup levels within the 231GW21 sample during the First Quarter 2006.

- Benzene (4,400 µg/L), ethylbenzene (230 µg/L), toluene (60 µg/L), and total xylenes (550 µg/L) concentrations within monitoring well 231GW22 were all detected within the range of historical concentrations measured within this well. However, the detected concentrations of benzene, ethylbenzene and total xylenes were all in excess of the their respective CAP-specified cleanup levels (Table A-10-3 and Figure A-10-8).

- MTBE was detected within 231GW28 at a concentration of 2.4 µg/L, which is significantly lower than the First Quarter 2006 detection within this well (12 µg/L), and closer to historical concentrations.

- Benzene and ethylbenzene were detected at concentrations (4,500 and 310 µg/L, respectively) exceeding their respective CAP-specified cleanup levels within 231PZ01 during the First Quarter 2006. The benzene concentration detected within 231PZ01 is lower than recent detections within this same piezometer. The ethylbenzene concentration had been dropping steadily since First Quarter 2003, but was elevated in First Quarter 2006. Toluene was not detected in 23PZ01 for the first time since Second Quarter 1999.

- Benzene was detected above its CAP-specified cleanup level of 1 µg/L within 231PZ02 (30 µg/L), 231PZ03 (280 µg/L), and 231PZ04 (440 µg/L) during the First Quarter 2006.

- Toluene was detected at new high concentrations within 231PZ03 (6.9 µg/L) and 231PZ04 (6.4 µg/L) during the First Quarter 2006.

Generally, VOC concentrations within Building 231/207 Area monitoring wells and piezometers are stable.

6.5 TOC and Dissolved Gas Results

TOC was analyzed within Building 231/207 Area groundwater samples collected during the First and Quarter 2006. TOC analytical results are presented in Table A-10-4 and are discussed below. TOC was detected in all Building 231/207 Area monitoring well and piezometer samples during the First Quarter 2006 and ranged from 0.74 mg/L in monitoring well 231GW17 to 45 mg/L in piezometers 231PZ01 and 231PZ02.

Dissolved gases (ethane, ethene, and methane) were removed from the program for evaluation of redox conditions, in accordance with recommendations from the *Technical Memorandum on Arsenic and Other Metals in Groundwater at Three CAP Sites* (MACTEC, 2006).

An evaluation of the redox state of site groundwater and related TOC results can be found in Section 7.0.

6.6 Dissolved Metals and TDS Results

The table below summarizes new high and low dissolved metal results for the First and Second Quarter 2006 within Building 231/207 Area monitoring wells and piezometers when compared to historical data, and provides the range and frequency of historical results (Table A-10-6). The total number of analyses may vary depending on the sampling frequency, the date sampling commenced, and on the number of duplicate analyses performed.

Location	Analyte	Detects / Samples	Historical Data		New High/Low First & Second Quarter 2006		Units
			Minimum	Maximum	Minimum	Maximum

Qualified data in the table above is indicated with an asterisk (*).

The majority of the new high or low detections were only slightly higher or lower than previous highs and lows or are the result of the relatively few groundwater samples collected for certain metals and are not considered significant. Significant dissolved metals detections are discussed below.

- Dissolved arsenic was detected in the primary, duplicate, and QC duplicate samples collected from 231GW21 at concentrations of 18, 22, and 19 µg/L, respectively. Dissolved arsenic was detected in both the primary and duplicate samples collected from 231GW22 at a concentration of 31 µg/L. Dissolved arsenic was detected above the CAP-specified cleanup level (10 µg/L) in samples from wells 231GW13, 231GW21, 231GW22, 231GW25, and 231PZ01. Additionally, dissolved arsenic was detected at the cleanup level within 231PZ04.

- Dissolved copper was detected at new high concentrations of 1.4, 2.8, and 1.1 µg/L within monitoring wells 231GW06, 231GW20, and 231GW23, respectively, and at a new high concentration of 1 µg/L within piezometer 231PZ01, during the First Quarter 2006. This is the first time dissolved copper has been detected within these locations. The detected concentrations do not exceed the CAP-specified cleanup level of 2.9 µg/L.

- Dissolved lead was detected in the primary, duplicate, and QC samples collected from 231GW21 at concentrations of 4.6, 6.3, and 4.2 µg/L, respectively, during the First Quarter 2006. Dissolved lead was also detected in the primary and duplicate samples collected from 231PZ01 at concentrations of 6.3 and 5.4 µg/L, respectively. All detected concentrations exceed the CAP-specified cleanup level of 2.5 µg/L.

- Dissolved manganese was not detected within monitoring wells 207GW03 and 231GW26 during the First Quarter 2006, for the first time since 1998 and 1997, respectively.

- Dissolved nickel was detected in monitoring well 231GW09 at a concentration of 29 µg/L during the First Quarter 2006, which exceeds the CAP-specified cleanup level of 8.2 µg/L, but is within the range of previous concentrations.

- Dissolved sodium was detected at a new low concentration of 14,000 µg/L within monitoring well 231GW20, during the First Quarter 2006. Sodium does not have a CAP-specified cleanup level.

- Dissolved zinc was detected at new high concentrations, but not above cleanup levels, within any Building 231/207 Area monitoring wells 231GW11, 231GW22 and piezometer 231PZ01 during the First Quarter 2006.

The percent recoveries for calcium, magnesium, manganese and sodium were outside the QAPP-specified 75-125% project acceptance criteria in the QC duplicate MS/MSD sample from

monitoring well 231GW10. The primary sample results for these metals were over four times greater than the amounts spiked, therefore, qualification was not required.

TDS was detected in all Building 231/207 Area groundwater samples at concentrations ranging from 240 mg/L in 231GW20 to 1,170 mg/L in the duplicate sample from monitoring well 231GW22.

An evaluation of the redox state of site groundwater and select dissolved metals results can be found in Section 7.0.

7.0 GROUNDWATER REDOX EVALUATION

Several parameters were measured in the field and in the laboratory to help determine the redox state of groundwater at the Building 231/207 Area. The following parameters were included in the groundwater monitoring program at the Building 231/207 Area during the First and Second Quarters 2006 and are indicators of changing redox potential within groundwater, with the exception of ORP. ORP is only measured in monitoring wells proposed for sampling by the 'low flow' method and only Building 231/207 Area monitoring wells 231GW10, 231GW16, 231GW21, 231GW22, and 231GW30 and piezometers 231PZ01 through 231PZ04 are sampled by 'low flow'. ORP measurements are located in the purge records, which are located at the conclusion of this section. The analytes and their use, in terms of determining the current redox state of site groundwater, are listed below.

- **Dissolved Oxygen** – Dissolved oxygen is a field measurement that is collected using a flow through cell or a down-hole probe. Low dissolved oxygen concentrations are typically associated with low redox potential and reducing environments. Dissolved oxygen in the presence of organic carbon is consumed by microorganisms during biodegradation processes and therefore low dissolved oxygen concentrations are indicative of microbial activity.

- **ORP** – ORP is a measurement that is collected in the field with the use of a flow through cell. Groundwater is pumped directly from the aquifer into the flow through cell without being exposed to air. The ORP is then measured by sensors within the flow through cell and recorded. ORP is a direct measurement of redox potential. However, ORP is not equivalent to redox potential. Depending on the type of sensor used and the temperature of the water, redox potential (eH) can be calculated. In general, the lower the ORP values the more reducing the water is, where as, the greater the ORP value the more oxidizing the water is. ORP measurements are recorded on the monitoring well purge records.

- **Nitrate/Nitrite** – The process of denitrification reduces nitrate to nitrite, which is ultimately reduced to nitrogen gas in reducing environments. A decreasing nitrate concentration trend in groundwater can be indicative of low redox potential, microbial

metabolism and a reducing environment. Increasing concentrations of nitrate are typically associated with a rising redox potential.

- **Sulfate/Sulfide** – Decreasing concentrations of sulfate indicate sulfate reduction is taking place due to a reducing environment. Decreasing concentrations of sulfate are usually associated with sulfide production (i.e. sulfide is a product of sulfate reduction) and the repeated presence of sulfide in groundwater further confirms that sulfate is being reduced.

- **TOC** – Decreasing trends in TOC over time indicate that microbial metabolism is taking place and TOC is being consumed.

- **Dissolved Arsenic, Iron and Manganese** – Increasing concentrations of arsenic, iron, and/or manganese can be typically associated with a decreasing redox potential. Decreasing concentrations of these metals in association with increasing sulfate concentrations can be associated with an increasing redox potential.

The above analytes and field measurements, were collected within all Building 231/207 Area monitoring wells proposed for sampling during the First and Second Quarters 2006. The following analytical results were detected during the First Quarter 2006 and provide an indication of the groundwater redox state at Building 231/207 as illustrated in Figures A-10-9 through A-10-11.

- Dissolved oxygen concentration measurements during the First Quarter 2006 were generally low (less than 1 mg/L), within the majority of shallow zone groundwater wells and piezometers, with the exception of 231GW09. The only monitoring wells with concentrations of dissolved oxygen measured above 1 mg/L were 231GW09 (shallow) and 231GW11 (shallow). These monitoring wells are located either upgradient or cross-gradient relative to Building 231.

- High nitrate concentrations (over 5 mg/L) were detected within monitoring wells 231GW09, 231GW17, 231GW18 and 231GW27. Nitrate was detected within three shallow, two intermediate and two deep monitoring wells during the First Quarter 2006.

- Nitrite was not detected within any Building 231/207 monitoring wells sampled during the First or Second Quarters 2006 (Table A-10-1).

- Sulfate was detected in the majority of groundwater samples collected from Building 231/207 during the First and Second Quarters 2006. The most significant observation made regarding sulfate concentrations within Building 231/207 Area monitoring wells and piezometers was the lack of sulfate in 231GW13, 231GW21, 231GW22, 231PZ03, and 231PZ04.

- Sulfide was detected in four samples during the First Quarter 2006 at concentrations ranging from 0.06 to 3.4 mg/L (Table A-10-1).

- TOC was detected in all Building 231/207 Area monitoring wells and piezometers sampled during the First Quarter 2006. During the First Quarter 2006, TOC concentrations ranged from 0.74 mg/L in monitoring well 231GW17 to 45 mg/L in piezometers 231PZ01 and 231PZ02.

- ORP was measured in all wells and piezometers during the First Quarter 2006 and within monitoring well 231GW09 during the Second Quarter 2006. During the First Quarter 2006, ORP measurements ranged from -217.7 to 238 millivolts (mV) within piezometer 231PZ02 and monitoring well 207GW03. During the Second Quarter 2006, ORP measured 33.7 mV within monitoring well 231GW09.

In addition to the above evaluation, modified redox diagrams were developed for each Building 231/207 Area monitoring well sampled. The redox diagrams were generated using the Sequence™ program and concentrations of shallow, intermediate and deep zone dissolved oxygen, nitrate, manganese, iron, sulfate and methane and are plotted on Figures A-10-9, A-10-10, and A-10-11, respectively. Each redox diagram consists of multiple axes, with each individual axis representing one of the above analytes. Each redox diagram is associated with one monitoring well location. The relative shape of each redox diagram represents an approximation of the redox state within the well studied. In general, the larger the polygon the more oxidizing the groundwater environment is at the well location, conversely, the smaller the polygon the more reducing the environment. Conceptual redox zone diagrams are illustrated on the aforementioned figures as examples of differing redox environments.

Building 231/207 Area redox diagrams (Figures A-10-9, A-10-10, and A-10-11) illustrate the differing redox environments across the site.

8.0 CONCLUSIONS & RECOMMENDATIONS

All Building 231/207 Area monitoring wells and piezometers were sampled during the First Quarter 2006 and monitoring well 231MW09 was the only monitoring well purged and sampled during the Second Quarter 2006.

The Draft Building 231/207 CAP was submitted to the stakeholders in 2005 for regulatory review. The CAP-specified cleanup levels have been compared to the First and Second Quarter 2006 groundwater data and are posted on Tables A-10-2, A-10-3, A10-5, and A-10-6. TPHg, TPHd, TPHfo, benzene, ethylbenzene, total xylenes, dissolved arsenic, lead and nickel were all detected at concentrations greater than their CAP-specified cleanup levels during the First Quarter 2006. Monitoring wells 231GW09, 231GW10, 231GW13, 231GW21, 231GW22, 231GW25, and piezometers 231PZ01 through 231PZ04 all had at least one detected

concentration of the above contaminants in excess of CAP-specified cleanup levels. Specific contaminant levels and groundwater exceedances are discussed in detail in Section 6.0 above.

Concentrations of TPH and VOCs within Building 231/207 Area monitoring wells continue to fluctuate within historical bounds.

Table 4. Groundwater Cleanup Levels
Corrective Action Plan
Building 207/231 Area
Presidio of San Francisco, California

Chemical [a]	Compilation of Applicable Cleanup Levels [b,c]						Lowest Applicable Cleanup Levels [e] (µg/L)
	Human Health Drinking Water Cleanup Level (µg/L)	Basis for Cleanup Level	Freshwater Toxicity Cleanup Level (µg/L)	Basis for Cleanup Level	Saltwater Toxicity Cleanup Level [d] (µg/L)	Basis for Cleanup Level	
Polychlorinated Biphenyls (PCBs)							
Aroclor 1016	0.5	Federal MCL	0.00017	CTR	0.03	CTR	**0.00017**

Notes:

µg/L	Micrograms per liter.
--	Not available.
MCL	Maximum contaminant level.
CTR	California Toxics Rule.
cPAH	Carcinogenic polycyclic aromatic hydrocarbons.
ESL	Environmental screening level (*RWQCB, 2005*).
FPALDR	Fuel Product Action Level Development Report (*MW, 1995c*).

Note: Shaded and bold values are lowest applicable cleanup values.

[a] Only chemicals detected in groundwater at the Building 207/231 Area are listed.

[b] For chemicals for which Presidio-specific cleanup levels have been developed, the cleanup levels were compiled from the Presidio-Wide Cleanup Level Document (*EKI, 2002*). For human health, these cleanup levels consist of MCLs or risk-based values developed in the FPALDR (*MW, 1995c*). For freshwater or saltwater toxicity, these cleanup levels consist of Basin Plan values (updated with *RWQCB, 2004*: freshwater Table 3-4 and saltwater Table 3-3 from the 4-day average), CTR values, or RWQCB Order values (updated with RWQCB Order R2-2003-0080 [*RWQCB, 2003*]: freshwater Table 7 and saltwater Table 6).

[c] For chemicals for which Presidio-specific cleanup levels have not been developed, the cleanup levels were compiled from ESLs for human health and for freshwater and saltwater toxicity for protection of aquatic life from *RWQCB, 2005* Table F-1a.

[d] Values apply to marine or saltwater environments. See footnote b for source information.

[e] Cleanup levels are lowest of Human Health, Freshwater, and Saltwater Toxicity values.

[f] TPH as diesel cleanup level value used.

[g] TPH as gasoline cleanup level value used.

Checked: JM
Approved: MAY

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
mg/L - milligrams per liter
°C - degree centigrade
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
mV - millivolts
NR - Not Reported
ORP - oxidation Reduction Potential
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 20
during previous quarters are identified in the respective quarterly reports.
2 - From Table 4 of the CAP.
3 - TPH analysis was not run using the silica gel cleanup method 3630A, although it was marked on the chain of custody.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
NM - Not measured
TPH - Total petroleum hydrocarbons
g - Hydrocarbon reported in the gasoline range does not match the gasoline standard.
H - Heavier hydrocarbons contributed to the quantitation.
L - Lighter hydrocarbons contributed to the quantitation.
ndp - Hydrocarbon reported does not match the pattern of the diesel standard.
NJ - The analysis indicates the presence of an analyte that has been "tentatively identified" and the associated numerical value represents its approximate concentration.
Y - Sample exhibits a fuel pattern that does not resemble the standard
Z - Sample exhibits unknown single peak or peaks.
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.
Bold numbers - indicate concentrations which exceed cleanup levels.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Second Quarter 2001. The analytical methods used during previous quarters are identified in the respective quarterly reports.
2 - From Table 4 of the CAP.
3 - These analytes were mistakenly not marked on the chain-of-custody by the field team during this sampling event.
µg/L - micrograms per liter
NA - Not analyzed
ND - Not detected
VOC - Volatile organic compound
1,3,5-TMB - 1,3,5-trimethylbenzene
1,2,4-TMB - 1,2,4-trimethylbenzene
1,2-DCA - 1,2-dichloroethane
MTBE - methyl tertiary-butyl ether
TCE - trichloroethene
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historical data qualifiers.
Bold numbers - indicate concentrations which exceed cleanup levels.
-- Cleanup level not established.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the Fourth Quarter 2004.
mg/L - milligrams per liter
TOC - Total Organic Carbon
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes

1 - The concentration of As V was determined by the laboratory by subtracting the As III concentration from the inorganic As concentration. As III has been detected at greater concentrations than inorganic As, due to analytical variability. As V is reported as non-detect when As III is detected at a greater concentration than inorganic As.
2 - From Table 4 of the CAP.
µg/L - micrograms per liter
Bold numbers indicate concentrations which exceed cleanup levels.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.
Table 11 in the main report identifies current and historical data qualifiers.

Notes
1 - The identified analytical method(s) are for analyses performed beginning in the First Quarter 2005.
2 - From Table 4 of the CAP.
3 - Due to computer/review error by the laboratory, sample 231GW09 was not analyzed by ICP-MS for the list of 22 metals. The sample had already been disposed of when the omission was discovered.
4 - Additional metals were analyzed as part of Fill Site 6 and are presented in Table A-3-3.
The analytical methods used during previous quarters are identified in the respective quarterly reports.
µg/L - micrograms per liter
mg/L - milligrams per liter
NA - Not analyzed
CL suffix denotes a quality control duplicate sample was sent to the control laboratory.
Table 7 in the main report identifies all duplicate and split samples and the well from which they were collected.

Table 11 in the main report identifies current and historic data qualifiers.

Bold numbers - indicate concentrations which exceed cleanup levels.
-- Cleanup level not established.

	08/27/01	2.14	13.30	11.16	MW
	05/08/01	1.79	13.30	11.51	MW

Notes
1 - All depth to water measurements are an average of three measurements recorded in the field.
2 - The depth to water was improperly recorded as 2.31 feet rather than 12.31 feet on 26 November 2001.
3 - This depth to water was measured on 6 December 2002. The depth to water measured on 2 December 2002 (2.27 feet) was determined to be in error.
MW- Monitoring well
PZ - Piezometer
NS - Not Surveyed
feet PLLW - feet above Presidio Lower Low Water vertical datum

Table A-10-8
Summary of Vertical Gradients at Well Clusters
Building 231/207 Area
Presidio of San Francisco, California

Well Cluster (WC)	Well Name	Date	Groundwater Zone	Groundwater Elevation (feet PLLW)	Screen Midpoint Elevation (feet PLLW)	Shallow/Intermediate Vertical Gradient (feet/foot) [1]	Intermediate/Deep Vertical Gradient (feet/foot) [1]	Shallow/Deep Vertical Gradient (feet/foot) [1]
WC-4	231GW22	08/11/03	Shallow	9.00	9.67	0.01	NC	NC
	231GW26	08/11/03	Intermediate	8.84	-1.99			
	231GW22	06/02/03	Shallow	9.41	9.67	0.04	NC	NC
	231GW26	06/02/03	Intermediate	8.91	-1.99			
	231GW22	03/10/03	Shallow	9.66	9.67	-0.01	NC	NC
	231GW26	03/10/03	Intermediate	9.8	-1.99			

Notes
NC - not calculated
1 - Vertical gradients are calculated by dividing the distance in groundwater elevations between two adjacent wells screened in separate water-bearing zones by the vertical distance between the midpoint elevations of the two well screens (Table 3). In each case, the value for the shallower well is subtracted from that of the deeper well. A positive value indicates a downward vertical gradient, while a negative number indicates an upward vertical gradient.
feet PLLW - feet above Presidio Lower Low Water vertical datum

N

150 0 150 Feet

LEGEND

- 231GW17 — Deep Groundwater Monitoring Well
- 231GW15 — Intermediate Groundwater Monitoring Well
- 231GW21 — Shallow Groundwater Monitoring Well
- 231PZ03 — Shallow Piezometer
- OW-1 — Temporary piezometer, location approximate
- Approximate Direction of Groundwater Flow
- 201 — Building and Number

Note: All axes are in normal scale, groundwater concentrations are in milligrams per liter (mg/L).

- Q1-2006 Groundwater Concentrations
- 35 — Q1-2006 Dissolved Arsenic Concentration (µg/L) (EPA Method SW6010/SW6020)

Notes:
Horizontal Datum: NAD 27, CA State Plane Coordinates, Zone 3, feet

Second Quarter 2006

MONITORING WELL SAMPLING LOG (Normal, Low Flow, and Low Yield)

Site / Area: Bldg. 231 Area
Well No.: 231GW09
Project Number: 2893
Well Type: [X] Monitor [ ] Extraction [ ] Other
Recorded By: D. Raynal
Sampled by: D. Raynal
Date: 5/24/06

WELL PURGING

PURGE VOLUME

Well casing diameter: [ ] 2-inch [X] 4-inch [ ] Other

Well Total Depth (TD, ft. below TOC): 19.98

Depth to Water (WL, ft. below TOC): 12.72

Depth to free phase (FP, ft. below TOC):

Number of borehole volumes to be purged: [ ] 3 [X] Not Applicable [ ] Other

Liquid in a 1 Foot Section of a Boring (gallons)		
Borehole Size	Casing Size	Water Volume/Ft
8	2	0.9
10	4	1.68
12	4	2.22

PURGE METHOD

[ ] Low Flow
[ ] Normal
[X] Modified (max 5 gpm)
[X] Bailer \ Type: Disposable
[ ] Pump \ Type
[ ] Other

PUMP INTAKE

[ ] Near top Depth (ft)
[ ] Near Bottom Depth (ft)
[ ] Other: N/A

PURGE VOLUME CALCULATION

Water Column Length X Water Volume/ft X No. Vols = gals CALCULATED PURGE VOLUME

Total Purge Time

Recharge Rate

Purge Rate: 1 gal. / 3 min.

3 gals ACTUAL PURGE VOLUME

GROUNDWATER PARAMETER MEASUREMENTS

Meter Type: Ultrameter / Turbidimeter

Time	/	Liters or Gallons	pH	Temp °C °F	DO (mg/L)	Sp. COND (µS/cm)	ORP (mV)	Turbidity (NTU)	Comments
initial	/	—	6.3	16.4	—	777	—	33	
931	/	1 gal.	6.4	16.5	—	772	—	47	
934	/	2 gal.	6.4	16.5	—	770	—	79	
937	/	3 gal.	6.5	16.5	2.64	768	337	128

Comments

Purge water storage/disposal: [ ] Drummed onsite [X] Other: Baker Tank Onsite

WELL SAMPLING

SAMPLING METHOD

Date/Time Sampled: 5/24/06 / 945

Purging Equipment: Pump - Type: Bailer - Type: Disposable Other:

Sample Filtered: Yes / No Filtered Sample Analysis: Dissolved Metals

SAMPLING PROGRAM

Sample No.	Container #/Volume	Laboratory	COC #	Comments
231GW09	1 L Poly NP	CAT	2148D.2	
	1 500 mL HNO3 Poly		2150	
	6 HCl VOAs			
	1 L NaOH + Zinc			
	1 Amber NP			

QUALITY CONTROL SAMPLES

Duplicate Samples

Original Sample No.	Duplicate Sample No.

Blank Samples

BUILDING 1065/1027 AREA
APPENDIX SECTION A-11
SEMI-ANNUAL GROUNDWATER MONITORING REPORT
FIRST AND SECOND QUARTERS 2006
Presidio of San Francisco, California

1.0 INTRODUCTION AND BACKGROUND

The Building 1065/1027 Area is located in the northeastern portion of the Presidio (Figure 1), between Gorgas Avenue to the north, General Kennedy Avenue to the east, Edie Road to the south, and a parking lot to the west. The site elevation ranges from approximately 13 to 26 feet above the PLLW datum (Montgomery Watson, 1997).
